Atomic Oxygen Effects

Sharon K.R. Miller
NASA Glenn Research Center
Cleveland, Ohio

Spacecraft Anomalies and Failures Workshop –
Act II, Chantilly, VA
July 24, 2014

This presentation does not include any material covered by ITAR
Environment Interaction Visible on Space Shuttle Tail Section
Atmospheric Composition

- Earth's Surface:
  - O2: 21.0%
  - N2: 78.0%

- 400 km Orbit:
  - N2: 95.9%
  - O: 4.1%
Atomic Oxygen in Low Earth Orbit

- **AO is the predominant species from 180-650 km**
- **Average ram energy \( \approx 4.5 \text{ eV} \)**

**Photodissociation of \( \text{O}_2 \)**

- UV Radiation
  - \( E = h\nu > 5.12 \text{ eV} (<243 \text{ nm}) \)

**O\(_2\) Diatomic Molecule**

**Atomic Oxygen**

**LDEF Spacecraft CTFE after**

\[ 8.99 \times 10^{21} \text{ atoms/cm}^2 \]

**Polychlorotrifluoroethylene (CTFE)**
Basic Atomic Oxygen Interaction with Organic Surfaces
Material Testing in an Atomic Oxygen Environment Using Ground-Based Systems
Material Tests in Low Earth Orbit (LEO) for Environment Interactions

Materials International Space Station Experiment (MISSE)

Long Duration Exposure Facility (LDEF)
# Atomic Oxygen Erosion Yields of Polymers Flown on MISSE-2 (PEACE)

Issues With Protective Coatings

Imperfections in Thin Film Coatings

Unprotected Polymer

Protected Polymer

Aluminized Kapton Flown on LDEF
Blanket Box Cover Failure of Aluminized Kapton Observed on ISS
Monte Carlo Computational Model Predictions

- 2-D Computational modeling of atomic oxygen erosion of polymers based on observed in-space results
- Takes into account:
  - Energy dependence of reaction probability
  - Angle of impact dependence on reaction probability
  - Thermalization of scattered oxygen atoms
  - Partial recombination at surfaces
  - Atomic oxygen scattering distribution functions
- Modeling parameters tuned to replicate in-space erosion

Aluminized on both sides

Aluminized on exposed side only
Atomic Oxygen Scattering

Thermal Energy Plasma

Total Transmittance as a Function of Wavelength for Coverglass Prior to and After Exposure to Atomic Oxygen

AR Coated

Conductive AR Coated

As Received

After AO Exposure to an Effective Fluence of 1.06e22 atoms/cm^2
Mirrored Silver Back of Solar Cell
Prior to and After Exposure to Atomic Oxygen

As Received

After Exposure to an AO Effective
Fluence of $2 \times 10^{21}$ atoms/cm$^2$
Oxidative Cracking of Silicone

DC 93-500 Silicone
Exposed to LEO Atomic Oxygen on STS-46

Fluence = $2.3 \times 10^{20}$ atoms/cm$^2$

Pre-flight

Post-flight
Stress Dependent Atomic Oxygen Erosion of Black Kapton XC

Polymers Exposed Under Stress on MISSE 6

Stress level: Force/Area = ~4000 psi (2.76e7 N/m²)
Strain = Stress/Modulus = 4000 psi/480000 psi (3.3e9 N/m²) = ~0.008
For Kapton XC this represents ~3% of the maximum strain and ~24% of the tensile strength

Kapton XC experienced a factor of 4 higher erosion rate under tension

Stressed UV-S-2
Exposed
Unstressed UV-U-2
Under Mount
Summary

• Atomic oxygen is the most predominant specie in LEO
• Atomic oxygen is reactive and energetic enough to break chemical bonds in materials
• Reaction products with polymers and carbon containing materials are volatile (typically CO and CO$_2$)
• Metals and inorganics experience surface oxidation in some cases leading to shrinkage and cracking or spalling
• Atomic oxygen can thermalize on contact and scatter from surfaces leading to further reaction, which is dependent on the materials it contacts and geometry
• The effect that atomic oxygen has on a particular material on a spacecraft is dependent upon how much atomic oxygen arrives at the surface, atom energy, and can be affected by mechanical loading, temperature, and other components in the environment (UV radiation, charged particles…)
• Each situation is unique and for accurate prediction of degradation of a material or component, it should be tested or modeled in a configuration representative of how it will be used
