Volcanic SO$_2$ clouds measured by TOMS

1978-2005

TOMS: Total Ozone Mapping Spectrometer

- Low sensitivity
- Low spatial resolution
- No altitude information
- No ‘monitoring’ capability
Pre-Aura view of global volcanic SO$_2$ emissions

A time-averaged inventory of subaerial volcanic sulfur emissions

R.J. Andres and A.D. Kasgnoc
Institute of Northern Engineering, University of Alaska Fairbanks

Abstract. A time-averaged inventory of subaerial volcanic sulfur (S) emissions was compiled primarily for the use of global S and sulfate modelers. This inventory relies upon the 25-year history of S, primarily sulfur dioxide (SO$_2$), measurements at volcanoes. Subaerial volcanic SO$_2$ emissions indicate a 13 Tg/a SO$_2$ time-averaged flux, based upon an early 1970s to 1997 time frame. When considering other S species present in volcanic emissions, a time-averaged inventory of subaerial volcanic S fluxes is 10.4 Tg/a S. These time-averaged fluxes are conservative minimum fluxes since they rely upon actual measurements. The temporal, spatial, and chemical inhomogeneities inherent to this system gave higher S fluxes in specific years. Despite its relatively small proportion in the atmospheric S cycle, the temporal and spatial distribution of volcanic S emissions provide disproportionate effects at local, regional, and global scales. This work contributes to the Global Emissions Inventory Activity.

Motivation:

- Volcanic S emission inventories ‘static’ and used ground-based data

[Graf et al., 1997; Andres & Kasgnoc, 1998; Halmer et al., 2002; Smith et al., 2011]
- SO$_2$ emissions in Ecuador and Colombia from Tungurahua, Reventador, Galeras and Huila volcanoes
- Volcanic emissions from Ubinas volcano (Peru) drift over Ilo region in 2006-2007
- Upgraded sulfur capture technology at Ilo reduces SO$_2$ emissions
- Shut-down of La Oroya smelter in mid-2009; reduction expected
Volcanic SO$_2$ emissions inventories are inaccurate

- OMI measurements indicate deficiencies in current ‘bottom up’ volcanic SO$_2$ emission inventories used in CTMs

REMOTE model simulation of annual mean SO$_2$ columns over Indonesia [Pfeffer et al., ACP, 2006]
Identification of global volcanic $SO_2$ sources

- $SO_2$ index defined using OMI ozone algorithm residuals (sensitive to $SO_2$)
- Rank top 1000 values of $SO_2$ index on each day (lat 65ºS – 80ºN)
- Locate active volcanoes within 50 km radius of these OMI pixels (using modified Smithsonian Global Volcanism Program database)
- Record unique volcanic sources for each day
- Repeat for each day of OMI measurements (>3200 from Sep 2004 – Dec 2013)
Persistent volcanic SO\textsubscript{2} sources (2004-2013; ~3200 days)

Number of days with detected SO$_2$ degassing

Average SO$_2$ Index

Reuters
SO$_2$ emission rate estimation from satellite data

\[ Q_{\text{meas}} = \frac{vM}{L} \]

- \( M = \) SO$_2$ mass in pixel (kg)
- \( v = \) wind speed (m s$^{-1}$)
- \( L = \) length of plume (m)
- \( Q = \) SO$_2$ flux (kg s$^{-1}$)

• Similar approach used to estimate smoke and NO$_2$ emissions from fires [Ichoku and Kaufman, 2005; Mebust et al., 2011]
• Note that asymmetry of OMI pixel affects plume detection
• Chemistry correction [Mebust et al., 2011] can be applied if SO$_2$ lifetime is known

\[ Q_{\text{meas}} = Q_{\text{init}} \tau t_c^{-1} \left[ 1 - \exp(-\tau^{-1} t_c) \right] \]

\[ t_c = L v^{-1} \]

Extreme SO$_2$ columns in volcanic clouds

- SO$_2$ in fresh eruption clouds – highest trace gas columns measured
- Challenge to validate extreme SO$_2$ column amounts – UAVs, balloons?
- More volc. SO$_2$ validation needed in general
- Complex radiative transfer (ash, hydrometeors)

[Yang et al., GRL, 2009]
Request from Icelandic Meteorological Office: ‘We are getting very nice OMI images of the SO₂ rich eruption cloud from the Holuhraun eruption. Could you help us to set up a way of turning the OMI observations into daily SO₂ mass and daily SO₂ emission rates? It’s possible this eruption will last weeks or months and so we need such a technique to be automated and fast.’

OMI SO₂ data used in: U.S., Mexico, Guatemala, El Salvador, Costa Rica, Montserrat, Ecuador, Colombia, Peru, Chile, New Zealand, Vanuatu, Indonesia, Papua New Guinea, Philippines, DR Congo, Ethiopia, Russia, France
Summary

• Science contributions and applications of Aura/OMI SO2
  – Identification of new volcanic and anthropogenic SO2 sources
  – Updated volcanic SO2 emissions inventory
  – Effect of small volcanic eruptions on climate
  – Radiative forcing of volcanic sulfate aerosol
  – Volcanic aerosol enhancement of lightning activity
  – Cloud seeding by volcanic aerosol downwind of volcanoes
  – Lifetime of SO2 in upper troposphere and lower stratosphere
  – Sulfur gas scavenging in eruption columns
  – Improving sulfur chemistry in CTMs
  – Volcanic plume tracking for aviation hazard mitigation
  – Detection of eruptions in remote regions

• Future developments in satellite SO2 observations
  – Improved spatial resolution (e.g., TROPOMI) -> better monitoring capability
  – Direct assimilation of volcanic SO2 observations into CTMs
