Mobile Space Robots
Applications on Earth

Bill Bluethmann, PhD
NASA Johnson Space Center
April 7, 2015
Mobility: Background

- A branch in the Robonaut family tree
  - Common design philosophy and components
Mobility: Common Themes

• Safety is paramount
  – Getting crew home is top priority in space
  – Translates to earth
  – Functional redundancy

• Extreme dexterity
  – Independent wheel modules
  – Active suspension
  – Crab steering

• Re-use to cut development time and cost

• Multiple control modes
  – Ride-on
  – Teleoperated
  – Autonomous and shared control modes
Developed beginning in 2007
Concept/prototype of crew rover developed for surface exploration
Goal: challenge the conventional wisdom of crew rovers
Designed for extreme terrain mobility
Six wheeled rover with each wheel module having 3 motions
Capable of being driven by on-board crew, tele-operation and ground control
Chariot Chassis

- Designed as a modular chassis carrying a variety of payloads
  - Crew in pressurized suits, standing up, Chariot style
  - Configured as a flat deck for general purpose payloads
  - Small Pressurized Rover Cabin (forming NASA’s Lunar Electric Rover)
  - Science and surveying instruments
  - Supplementary power
- Currently two models in 1st generation series
Chariot Chassis: Video
Space Exploration Vehicle

- Pressurized Mobile Habitat consisting of:
  - Small Pressurized Rover cabin
  - Chariot chassis
- Crew explores in shirt sleeves
- Access to space through suit ports
  - No airlock
  - Direct access to suits from cabin
  - EVA in 15 minutes vs. 4 hours on Space Station
- Nominal operations: 2 astronauts for 3, 7 or 14 days
  - 4 crew for up to 24 hours
Features:
- 2 person cockpit
- Redundant driving stations
- Separate crew areas with privacy curtains
- Storage for up to 14 days
- Water system
- Waste control system
- Exercise devices
- Hatches with docking ports
- Aft driving station
- Aft enclosure for suit dust and thermal protection
Space Exploration Vehicle
Modular Robotic Vehicle

- NASA developed unique skills in Astronaut rovers during NASA’s Constellation program (2006-2010),
  - Focus on safety & reliability
  - R&D scale of investment
  - Highly maneuverable vehicles
  - Rigorous testing
  - Different requirements than Mars rovers
  - Dual purpose: Astronaut or robotically driven
- MRV projects spins technologies to terrestrial applications
MRV: Unique Vehicle Capabilities

- Fail-operational *drive-by-wire* design
  - Focus on vehicle safety under fault conditions
- Independent, modular wheel systems
- Extreme maneuverability
- Battery electric vehicle
- Designed for robotic control: remote and autonomous driving
MRV: Vehicle Specs

- Design speed: 64 kph (40 mph)
  - Currently computer limited to 25 kph (15 mph)
- Curb weight: 900 kg (2000 lb)
- Footprint: 2.15 x 1.55 m (7’ x 5’)
- Drive-by-wire without mechanical backup
MRV: Video
Concluding Remarks
