High-Fidelity Simulation of Jet Noise From Rectangular Nozzles

Large eddy simulation (LES) model for noise reduction in advanced jet engines and automobiles

This Phase II project validated a state-of-the-art LES model, coupled with a Ffowcs Williams–Hawkings (FW-H) far-field acoustic solver, to support the development of advanced engine concepts. These concepts include innovative flow control strategies to attenuate jet noise emissions. The end-to-end LES/FW-H noise prediction model was demonstrated and validated by applying it to rectangular nozzle designs with a high aspect ratio. The model also was validated against acoustic and flow-field data from a realistic jet-pylon experiment, thereby significantly advancing the state of the art for LES.

Applications

NASA

- Supersonic aircraft:
  - High-fidelity LES modeling for noise control
  - Testing of scale-model single or dual rectangular nozzles
  - Testing of nozzles with chevrons and bevels
- Subsonic fixed-wing aircraft:
  - Testing of high aspect ratio rectangular nozzles

Commercial

- U.S. Navy:
  - Noise suppression technology for the F/A-18E/F and Joint Strike Fighter F-35B programs
  - Retrofits for F414-400 engine, F404-400 engine, and F/A-18C/D aircraft
  - High-fidelity modeling for next-generation propulsion systems
- Automotive:
  - High-fidelity predictive tools for noise reduction caused by vortex shedding of side-view mirrors

Phase II Objectives

- Upgrade the LES for accurate interfacing with the nozzle internal flow field, including the effects of the nozzle boundary layer turbulence on initial shear layer growth
- Rectify overprediction of initial turbulent velocity statistics at the nozzle lipline
- Validate the LES/FW-H for performing flow-field predictions of high aspect ratio rectangular and bevel nozzle free jets using detailed flow-field and acoustic measurements
- Provide validation of the LES/FW-H model for predicting noise emissions for a real-world engine installation with effects of pylon on far-field noise

Benefits

- Provides highly predictive modeling
- Reduces noise in jet engines and automobiles
