# Key Challenges of Human Exploration of Mars

## Common Findings from Multiple Studies

**1,000 Days**

Total time crew is away from Earth

Maximum surface stay for any given mission

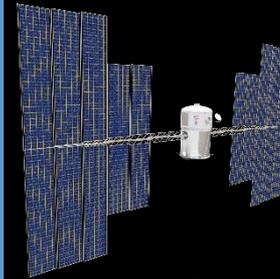

**500 Days**

**44 min**

Maximum two-way communication time delay

**100-200 kWe**

Total continuous transportation power

**130 t**

Heavy-Lift Mass

**Multiple**

Launches per mission

**20-30 t**

Ability to land large payloads

**12 km/s**

Highest Orion Earth entry speed

**100 km**

Distance for long-range routine exploration

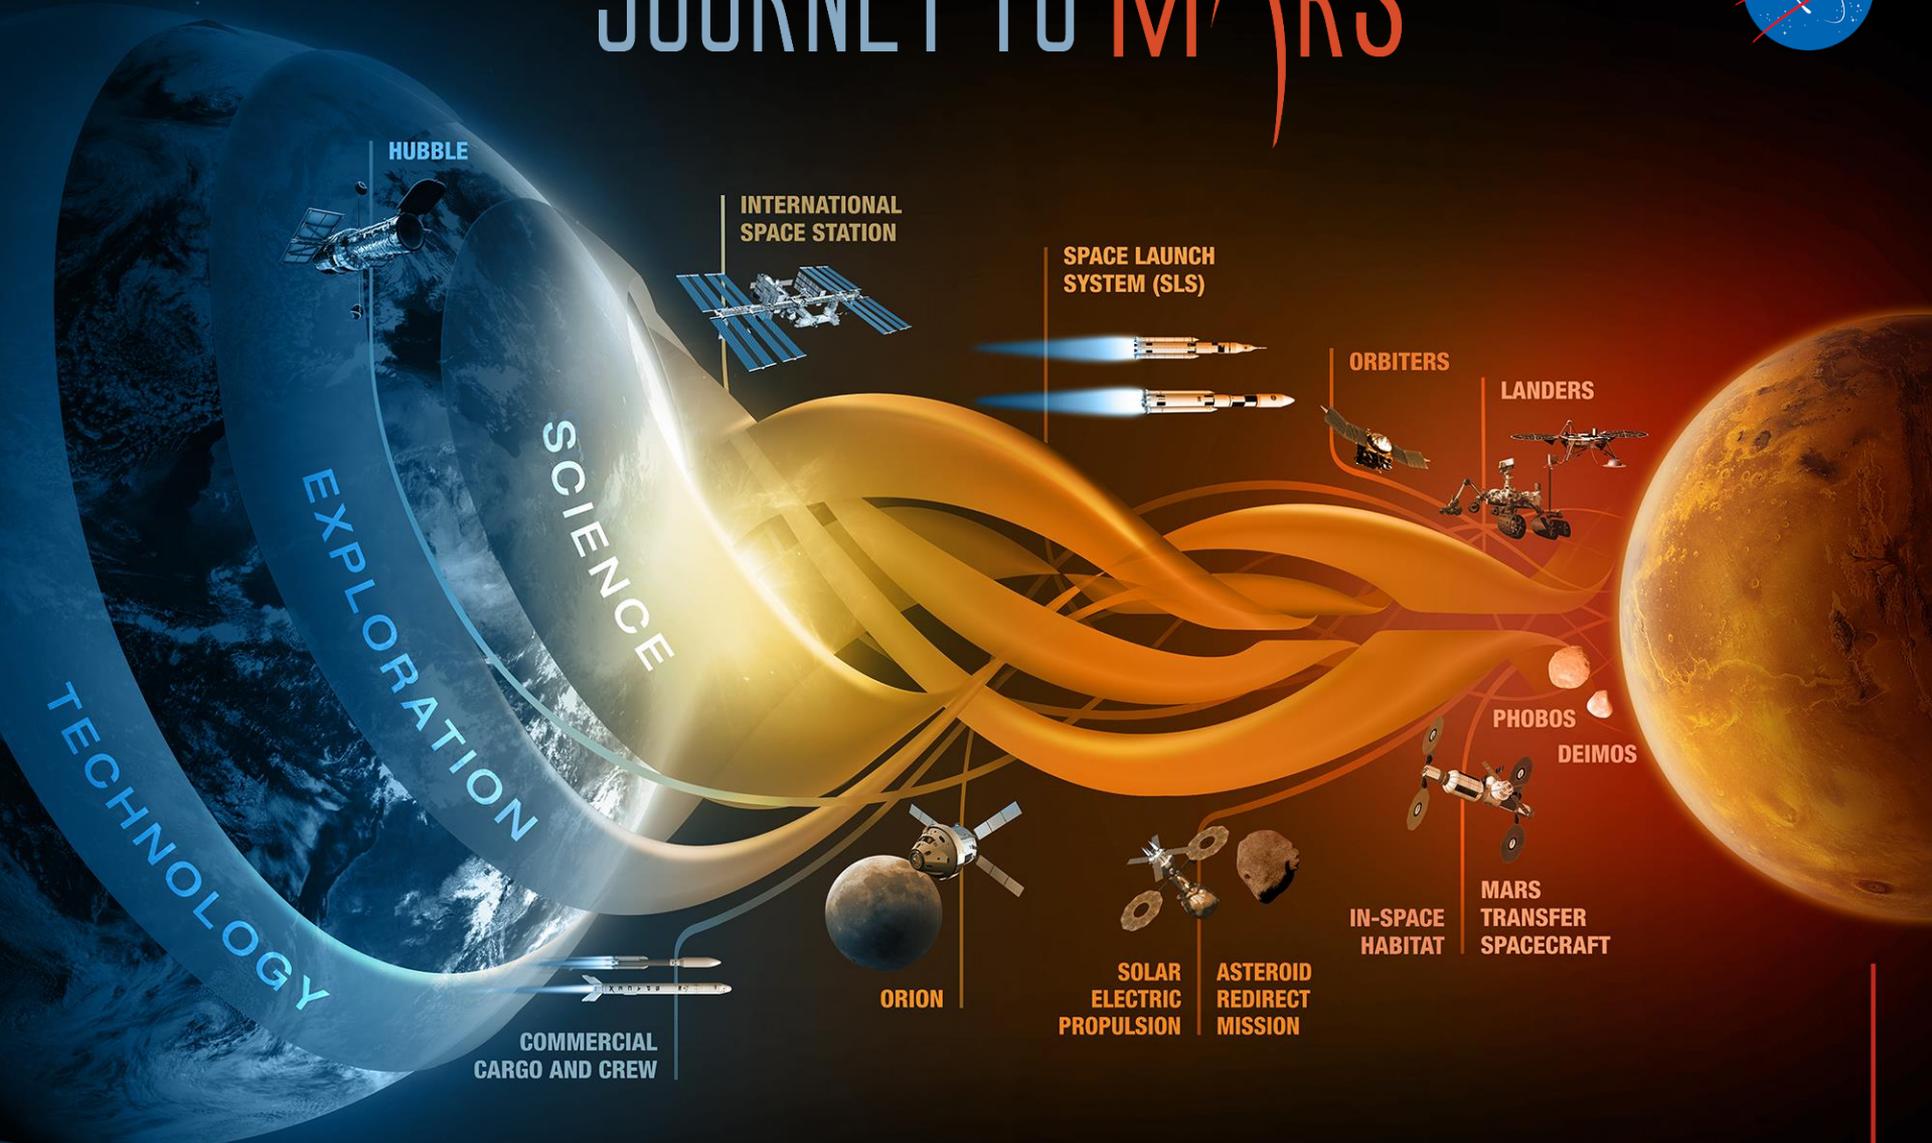

**20 t**

Oxygen produced for ascent to orbit

# JOURNEY TO MARS

DEIMOS

MARS TRANSFER SPACECRAFT

IN-SPACE HABITAT

SOLAR ELECTRIC PROPULSION

ASTEROID REDIRECT MISSION

ORION

COMMERCIAL CARGO AND CREW

MISSIONS: 6-12 MONTHS  
RETURN: HOURS

EARTH RELIANT

MISSIONS: 1 TO 12 MONTHS  
RETURN: DAYS

PROVING GROUND

MISSIONS: 2 TO 3 YEARS  
RETURN: MONTHS

EARTH INDEPENDENT

# International Space Station

The First Step in Exploration

Human Health Research

Advanced Life Support

Technology Demonstration

Logistics Management

Maintenance & Repair

International Collaboration

# Proving Ground Objectives

## Enabling Human Missions to Mars

### **VALIDATE** through analysis and flights

- Cis-lunar space as a staging point for vehicles in route to Mars
- Advanced Solar Electric Propulsion for efficient mass delivery
- Crew health and performance in a deep space environment
- Space Launch System and Orion in deep space
- Long-duration, deep space habitation systems
- Operations with reduced logistics capability
- Structures and mechanisms
- In-Situ Resource Utilization

### **CONDUCT**

- EVAs in deep space with sample handling
- Integrated human and robotic mission operations
- Capability pathfinder missions to reduce strategic knowledge gaps

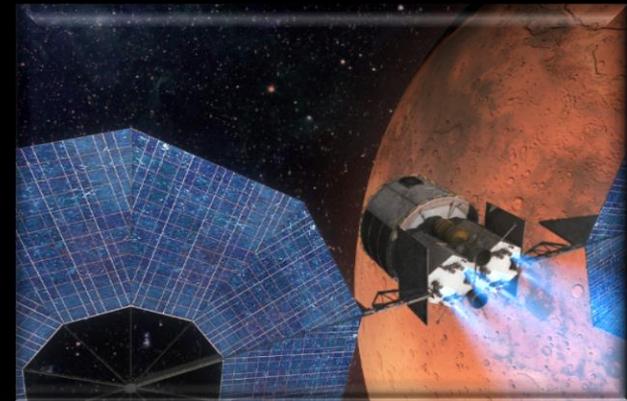

### Evolvable Mars Campaign

- ✓ Leverages current investments in ISS, SLS, Orion, ARM, and habitation, technology development, science activities
- ✓ Emphasizes prepositioning and reuse/repurposing of systems

# Three New Neighborhoods to Explore

## Mars Vicinity Provides the Pull

### Mars Orbit

- Round-trip to/from orbit
- Humans in zero-g
- Opportunities:
  - Real-time teleoperation
  - Support Mars sample return

### Mars Moons

- Round-trip to/from orbit
- Humans in low-g
- Enhanced radiation protection
- Opportunities:
  - Mars moon exploration
  - Real-time teleoperation
  - Mars & moons sample return

### Mars Surface

- First steps on Mars
- Humans in partial-g
- Enhanced radiation protection
- Use resources of Mars
- Initiate pioneering
- Opportunities:
  - Search for signs of life
  - Robust exploration
  - Mars sample return

# Split Mission Concept

## Pre-Deploy Cargo First

DESTINATION  
SYSTEMS  
SEP pre-deploy to  
Mars orbit

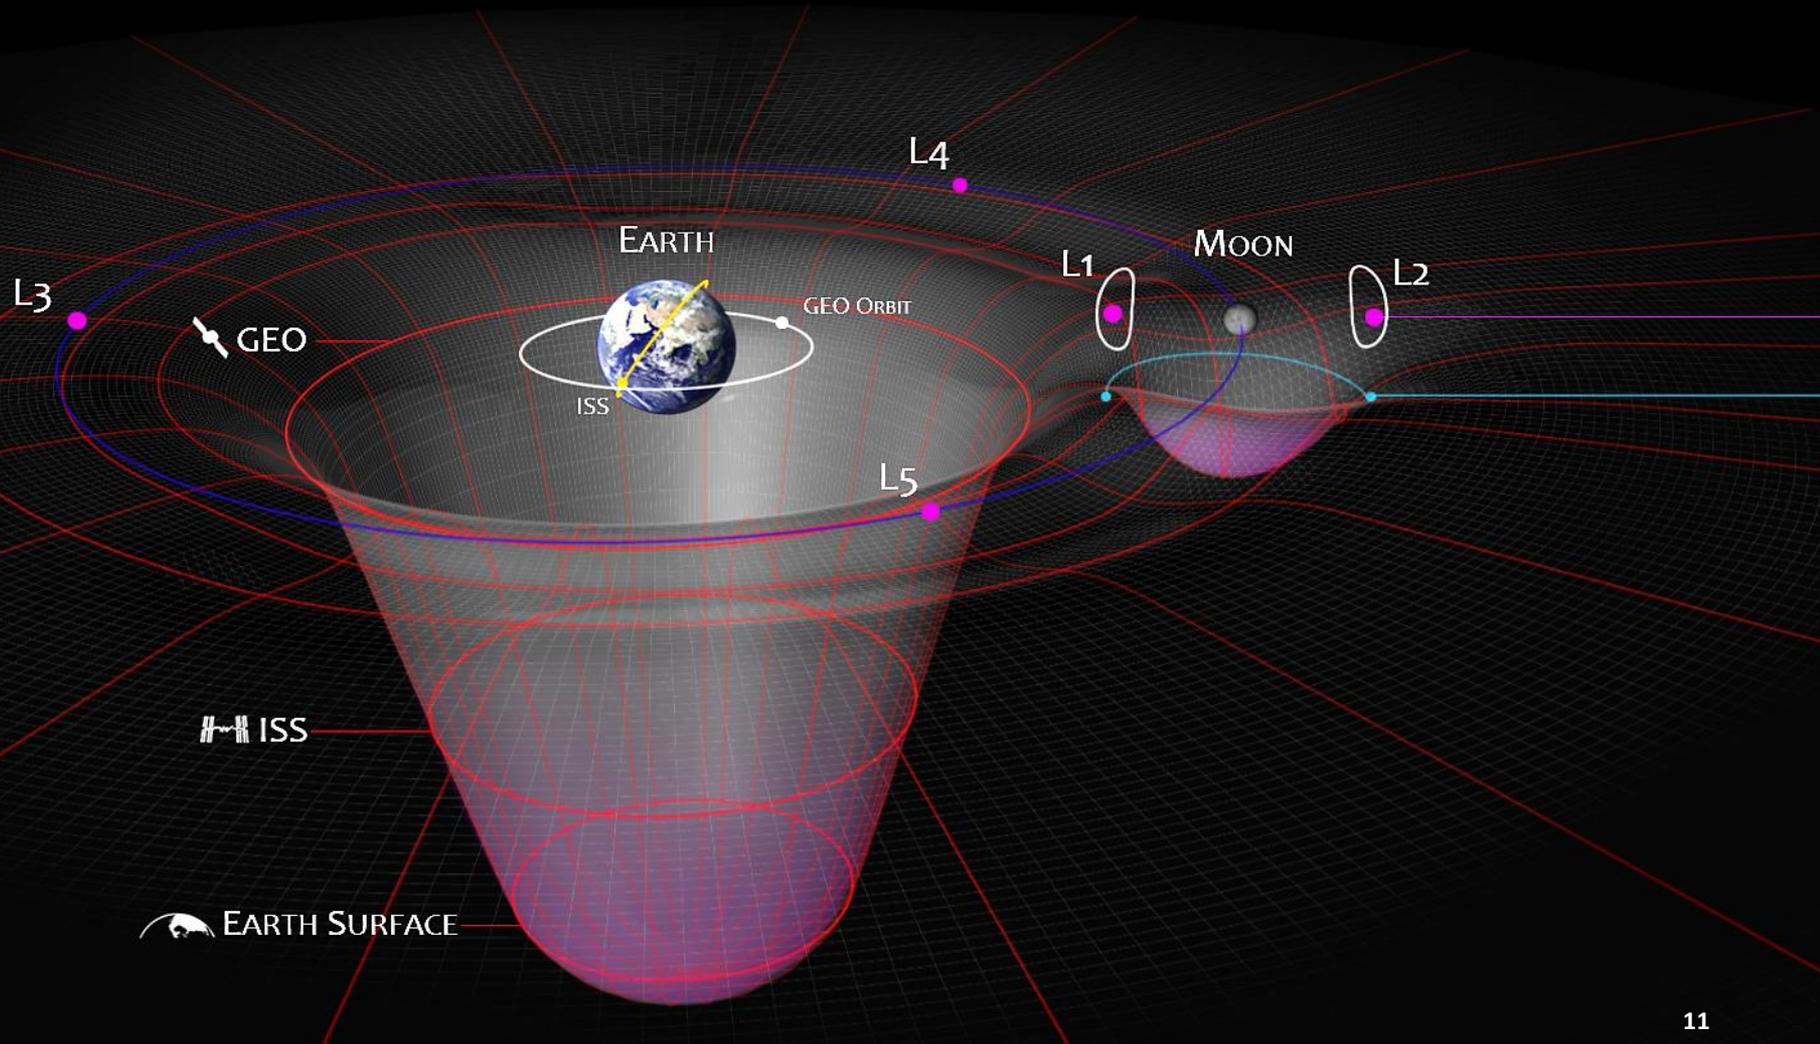

Transit: 2-3 Years

Surface Operations:  
30-500 Days

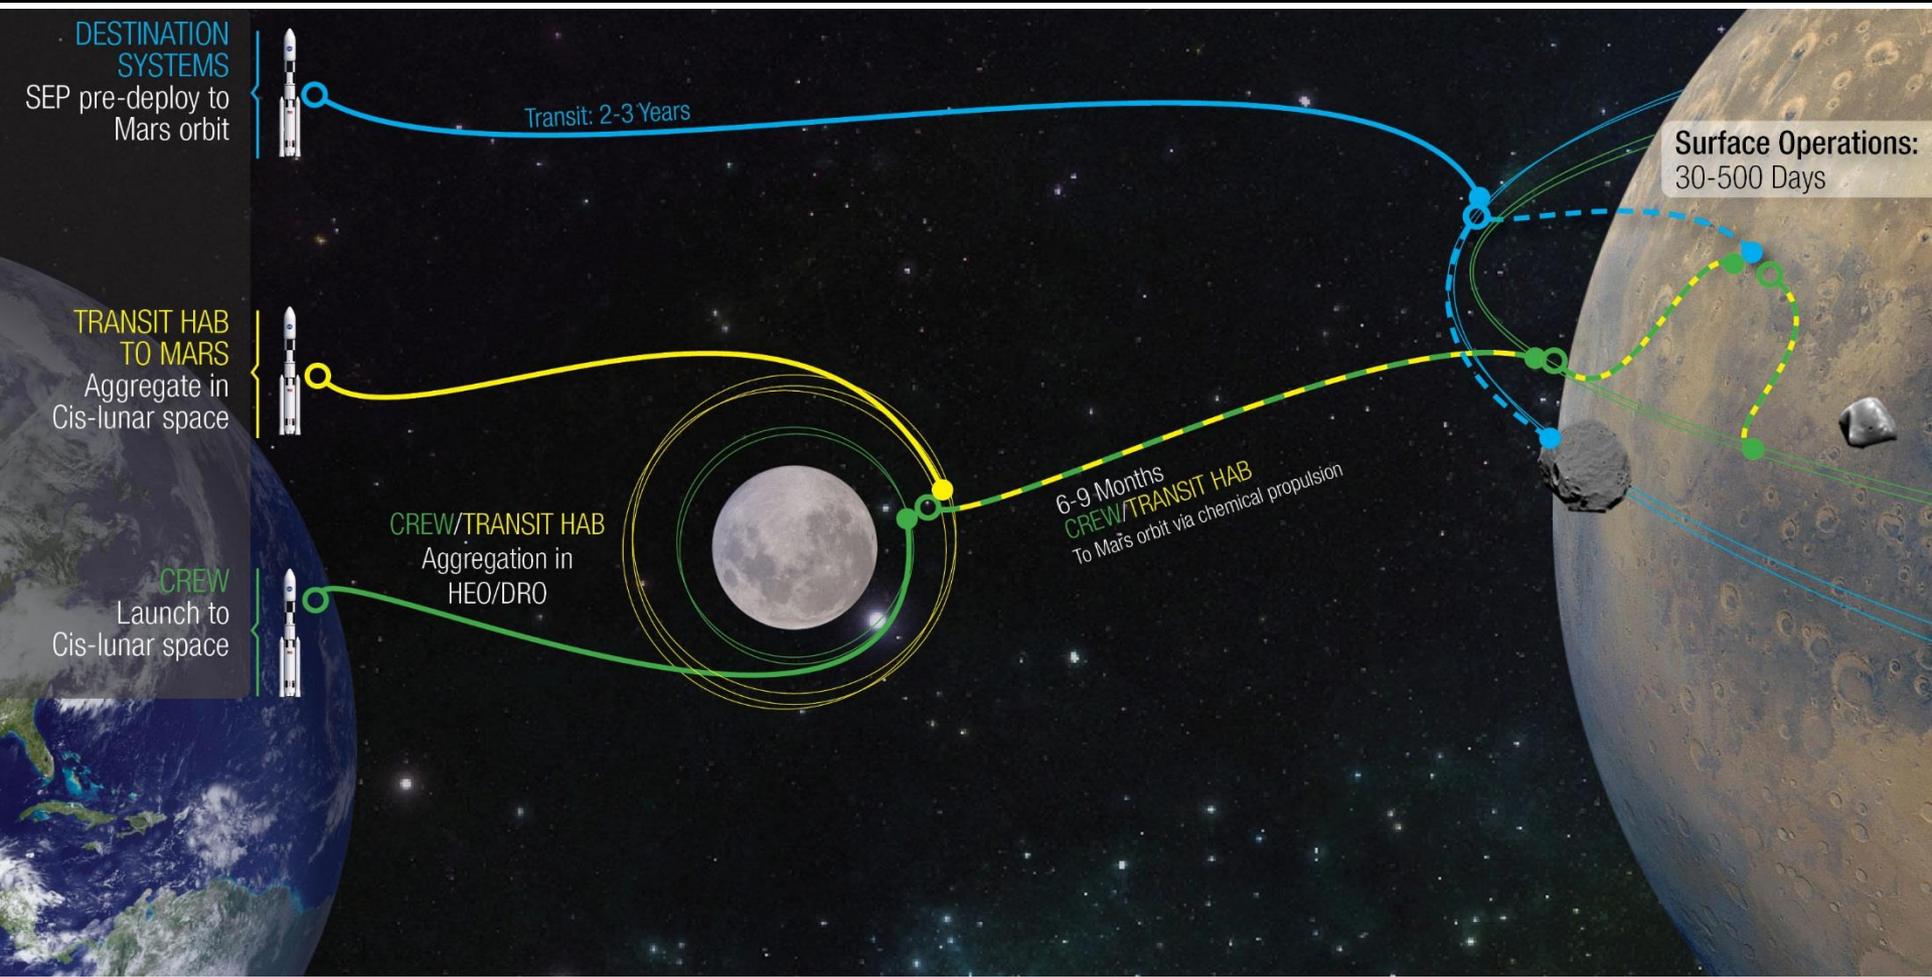

# Cis-Lunar Space

How the Earth and the Moon Interact

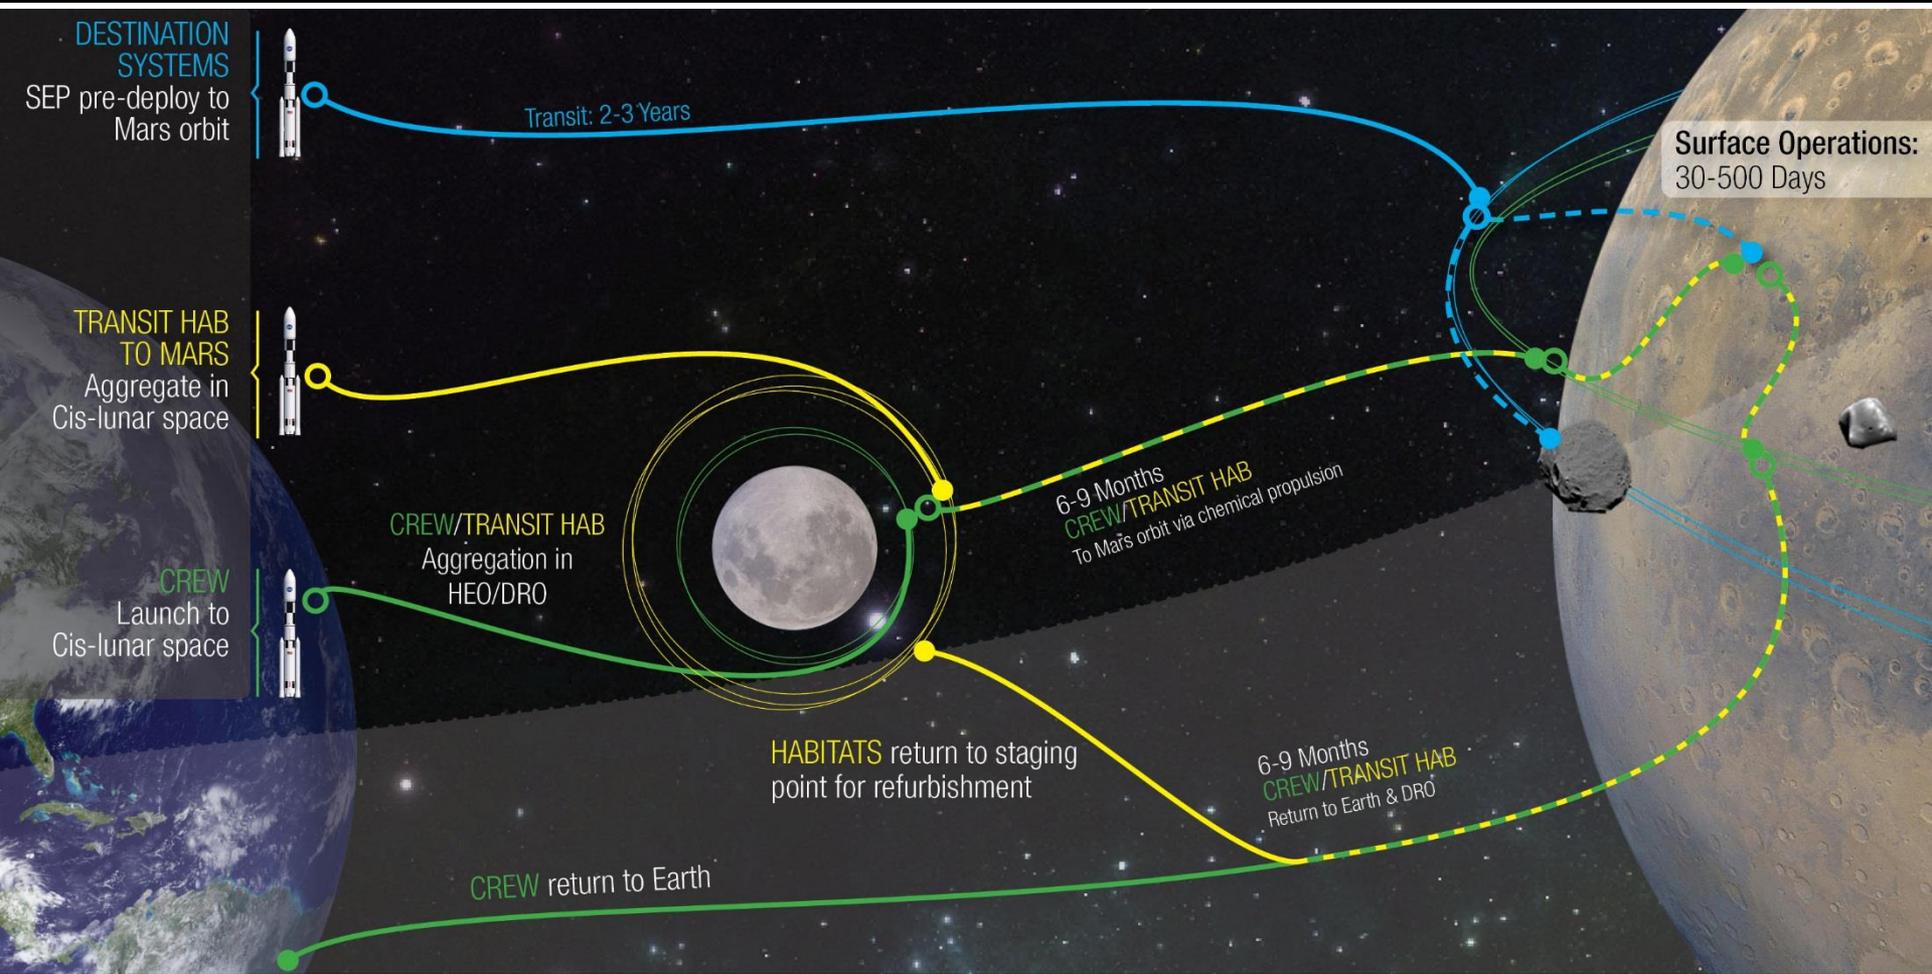

# Split Mission Concept

## Crew to Mars Orbit

# Split Mission Concept

## Crew Return to Earth

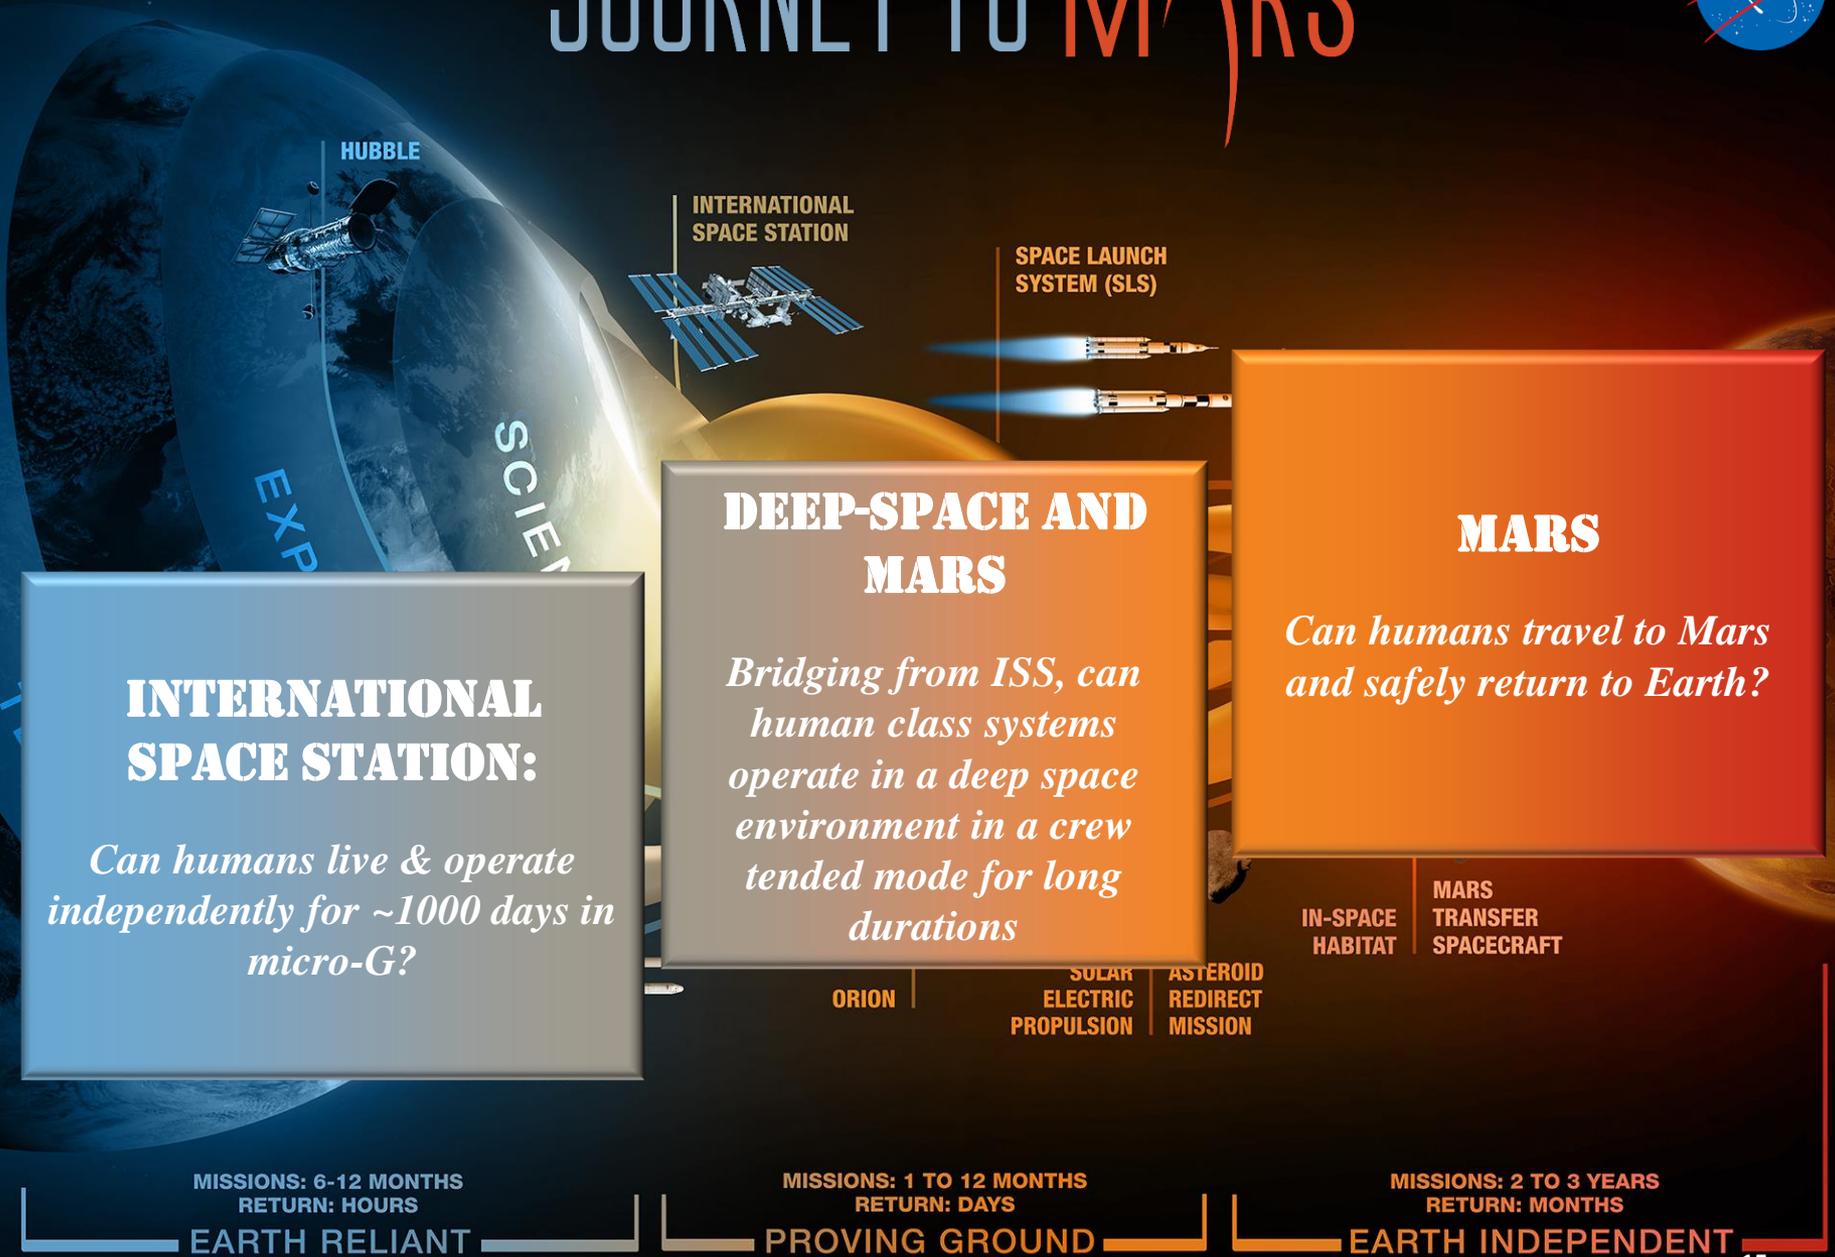

# Pioneering Space

- Is more than the human missions to the Mars surface
- Is the ability to “go further and stay longer”
  - With an ever decreasing need to be reliant on Earth
  - Building an infrastructure that supports the logistics that are required for sustained living in space
- Is the gradual transition from our current permanent presence in LEO to permanent presence in deep space (which includes the surface of Mars)
- Is finding the sustainable pieces that supports the logistics and capabilities required
  - From a technical approach
  - But also promotes economic expansion

# JOURNEY TO MARS

# So how will we go to Mars?

"Throughout human history, in any great endeavor requiring the common effort of many nations and men and women everywhere, we have learned - it is only through seriousness of purpose and persistence that we ultimately carry the day. **We might liken it to riding a bicycle. You stay upright and move forward so long as you keep up the momentum.**"

— Ban Ki-moon

Secretary General, United Nations

NASA'S JOURNEY TO
