Aqua/Aura
QuickDAM (QDAM) 2.0 Ops Concept

John Nidhiry
Flight Operations Team
June 3, 2015
QDAM Goals

• **Reduce work load and dependency on staff and systems.**
  – Enhance capabilities so that repetitive processes are not necessary for every option.
  – Streamline process so that unnecessary preparation steps, systems, personnel are not needed.

• **Reduce turn-around time and provide emergency last minute capabilities.**
  – With Drag Make Up (DMU) and Risk Mitigation Maneuver (RMM) flow, all steps must be completed, in order to execute a burn.
  – Create a streamlined and safe process to be able to prepare for RMMs with minimal time so that the Flight Operations Team (FOT) does not have to ‘gear up’ for every plausible RMM scenario.
  – This would also save the FOT from having to ‘waive off’ RMMs where the threat self-mitigates.

• **Increase burn parameter flexibility.**
  – Execution time of burn and burn duration are fixed in stored command sequence (SCS).
  – In RMM scenarios, sometimes last minute tracking updates cause a desired change in burn parameters.
Summary of Previous RMM Capability Enhancements

• **Manual Instrument Commanding for Aqua**
  – SCSs were developed that would allow the FOT to configure two instruments (CERES and AIRS) without having to place the commands in the daily stored command load built two days before the maneuver date.
  – This allowed more flexibility in changing the time of maneuver.
  – This also gave the capability to execute a maneuver with less warning and preparation time.

• **No Slew DMUs and RMMs**
  – In 2012 the FOT developed a method of conducting DMUs and RMMs without performing the wheel based yaw slew maneuver necessary to align the thrusts with the orbital velocity vector before hand.
  – By eliminating the slew out and slew back, the DMU and RMM sequence was greatly simplified, making it easier to plan multiple options, requiring less contacts and load building.
• QDAM 2.0 is actually the 5th generation operational RMM enhancement implemented.
  – Variable Burn Duration (VBD) Slewed version
  – QDAM 1.0 Slewed version
  – Variable Burn Duration (VBD) No-Slew version
  – QDAM 1.0 No-Slew version
  – QDAM 2.0 (No-Slew)

• QDAM 2.0 Key Enhancements over QDAM 1.0
  – There were 3 critical drawbacks with the QDAM 1.0 No-Slew version presently onboard.
    1 - A communications contact was needed to execute the burn, limiting options, and making obtaining communications contacts a critical step.
    2 - The burn would execute at an imprecise time whenever command was sent real-time.
    3 - Only pre-canned burn durations were available, limiting burn size fidelity.

  – These key drawbacks made QDAM 1.0 an emergency only option and was never utilized.

• QDAM 2.0 Key Enhancements over VBD
  – More flexibility to change the burn duration at time of execution.
  – Reduced the number of SCSs required if many different durations were being at any same start time.
  – Pre-canned options were no longer limited.
SCS Background

- From DMU to DMU, there are only two things in the custom built SCS that vary.
  - Absolute time delay, 32-bit unsigned integer in GIRD epoch seconds.
  - The burn duration (BD), 32-bit floating point.
QDAM 1.0 Concept

- Replaced the first absolute time delay with a no-op. So SCS runs as soon as its activated.
- Replaced burn duration command with a call to another ‘sub’-SCS. There are multiple versions of this sub-SCS with different burn durations that user can uplink.
QDAM 2.0 Concept

Since QDAM 1.0 had the critical flaws that made it an emergency only option, it was desired to make a new concept that can be used for all DAMs.

- It was proposed that a memory write command could be used to overwrite the absolute time and burn duration memory with whatever the user wants.

- However memory write commands cannot overwrite “protected memory” areas; such as SCSs, algorithms.

- In response, the ground system maintenance contractor (Raytheon) created a new ground system command that mimicked a memory load.

- The FOT has completed testing on these commands.
New vs Old DAM Flows
Past Nominal RMM vs Quick DAM 2.0 Planning Flows

Past Nominal RMM Flow

- Step One: CARA, FDS, FOT, ESMO Decide Burn Options
  - 1-2 days before RMM
- Step Two: GNC Delivers Maneuver Plan
  - 1-2 days before RMM

Quick DAM 2.0 Flow

- Step One: CARA, FDS, FOT, ESMO Decide GDAM Burn Options
- Step Two: GNC Notifies FOT and Delivers Maneuver Plan
- Step Three: COMMPAS Requests Critical Contacts
  - 1-2 days before GOAM
- Step Four: GNC and CM Build Maneuver SCSs
  - 1-2 days before RMM
- Step Five: COMMPAS Verifies Critical Contacts
  - 1-2 days before GOAM
- Step Six: FDS Delivers DMU Products to RMM
  - 1-2 days before RMM
- Step Seven: GNC and FSW Verify Maneuver SCSs
  - 1-2 days before RMM
- Step Eight: GNC and FSW Verify Instrument Configurations
  - 1-2 days before GOAM
- Step Nine: COMMPAS Verifies MCL Commanding
  - 1-2 days before GOAM
- Step Ten: FOT Prepares DMU Day Plan, CAM & PPCRs
  - 1 day before GOAM
- Step Eleven: FOT Executes RMM Maneuver
  - 1 day before GOAM

All burn time options must satisfy instrument and comm constraints. These 4 steps repeated for each option.

Contacts will not be as critical but should be obtained when possible.
Past Nominal RMM vs Quick DAM 2.0 Execution Flows

Past Nominal RMM Flow:
- **Step One**: GNC executes SC's pointing PPIC (7 pg).
- **Step Two**: GNC executes Propulsion Setup PPIC (7 hr).
- **Step Three**: FOT executes Maneuver Go PPIC(7).
- **Step Four**: DMU Maneuver (Pre-AHM, Burn, Post-AHM).

Quick DAM 2.0 Flow:
- **Step One**: FOT executes GO from MD to Execute QDAM.
- **Step Two**: GNC executes QDAM Parameter Setup PPIC(7 hr).
- **Step Three**: FOT executes Maneuver Go PPIC(7).
- **Step Four**: QDAM Maneuver (Pre-AHM, Burn, Post-AHM).
Original RMM vs Quick DAM 2.0
Execution Timeline

**Original RMM**
- Real Time Setup Commanding
- Instruments Configure (Aqua)
- Slew Out to ~14° Yaw (~9 min)
- Change to Thruster Mode and Burn (~3 min)
- Slew Back ~14° Yaw (~9 min)
- Real Time Clean Up Commanding (~1-1.75 hrs)
- Instruments Configure Back (Aqua)
- 2-4 hrs
- ~2-20 min
- 10 - ~30 min
- 10 - ~30 min
- 10 - ~30 min
- 2-4 hrs

**QuickDAM 2.0**
- Real Time Setup Commanding
- Instruments Configure (Aqua)
- Change to Thruster Mode and Burn (~3 min)
- Real Time Clean Up Commanding
- Instruments Configure Back (Aqua)
- 1-2 hrs

**Real Time Commanding**
**Daily Command Load (MCL)**
**Maneuver SCS**
**Generic Onboard SCS**
