Abstract: This poster introduces a feeding concept aimed at simplifying the back-end (phase shifters) of traditional phased arrays. As an alternative to traditional phased arrays, we employ a traveling wave array (TWA) using a single feedline whose propagation constant is controlled via a single, small mechanical movement without a need for phase shifters to enable scanning. Specifically, a dielectric plunger is positioned within a parallel plate waveguide (PPW) transmission line (TL) that feeds the TWA. By adjusting the position of the dielectric plunger within the PPW feeding the TWA, beam steering is achieved. A 20 element array is designed at 13GHz shown to give stable realized gain across the angular range of $-25^\circ \leq \theta \leq 25^\circ$. A proof of concept array is fabricated and measured to demonstrate and validate the concept’s operation.

### Operation Principle
- Array elements fed via propagation reconfigurable transmission line
- $k_{eff}$ reconfigured via small mechanical movement
- Phase delivered to each element a function of $k_{eff}$
- Array scanned with only the small mechanical movement

### Transmission Line Design
- Scan range a function of element spacing and TL $k_{eff}$
- $-30^\circ \leq \theta \leq 30^\circ$ scanning is achieved with $1.04 \leq k_{eff} \leq 2.04$ for and element spacing of 0.65$\lambda$
- Line achieves the necessary $k_{eff}$ agility at $H_2 = 270\text{mil}$

### Array Design Procedure
- Characterize coupling from element over a range of slot widths
- Choose the element widths along the TWA to achieve the desired Kaiser taper
- Iteratively adjust slot widths to account for element reflections and mutual coupling until desired pattern is achieved

### Initial Design Performance
- S-Parameters generally less than $-10\text{dB}$ except around boresight scan as expected
- Scanning of $-25^\circ \leq \theta \leq 25^\circ$
- Consistent realized gain level across scan range

### Increased Manufacturability
- 10 Steps to approximate cavity back
- Reduced plunger height
- Alter TL geometry and element spacing to achieve desired scan range

### Prototype Validation
- Measurements generally agree with simulation
- Realized gain is down compared to simulated due to differences in TL geometry
- Measured scan angle is more positive, also due to differences in TL geometry
