Abstract Submittal Form

Abstract Due Date: Friday, January 16, 2015

Fields with an asterisk (*) are required.

* Title: Green Propellant Demonstration with Hydrazine Catalyst of F-16 Emergency Power Unit

* Submitted to: □ JPM  □ MSS  □ LPS  ☑ SPS

Refer to Call for Papers for description of Mission Areas and select one from the choices below.

* Mission Area : ☑ 1  ☑ 2  ☑ 3  ☑ 4  ☑ 5  ☑ 6  □ 7

* Updated Paper? □ Yes  ☑ No  

* Student Paper? □ Yes  ☑ No

Sponsoring organization if SBIR-funded: N/A

Primary Author (this author will receive all correspondence regarding participation in this program)

* Name: Joel W. Robinson

* Organization: NASA/MSFC/CS10

* Address: B4200/624

* City: Marshall Space Flight Center  * State: AL  * ZIP Code: 35812

* Phone: 256-544-3513  * Fax: 256-544-5314  * Email: joel.w.robinson@nasa.gov

2nd Author  Please provide full contact information for each author.

Name: Shawn Brechbill

Organization: NASA/MSFC/ER33

Address: B4203/4219

City: Marshall Space Flight Center  * State: AL  * ZIP Code: 35812

Phone: 256-544-3466  * Fax:  

Email: shawn.e.brechbill@nasa.gov

3rd Author  Please provide full contact information for each author.

Name: 

Organization: 

Address: 

City:  * State:  * ZIP Code: 

Phone:  * Fax:  

Email: 

4th Author  Please provide full contact information for each author.

* Approval

□ Approved by Management (indicates required resources are available to prepare, submit, and present this paper at the above subject JANNAF Meeting)
Some space vehicle and aircraft Auxiliary Power Units (APUs) use hydrazine propellant for generating power. Hydrazine is a toxic, hazardous fuel which requires special safety equipment and processes for handling and loading. In recent years, there has been development of two green propellants that could enable their use in APU’s: the Swedish LMP-103S and the Air Force Research Laboratory (AFRL) AF-M315E. While there has been work on development of these propellants for thruster applications (Prisma and Green Propulsion Infusion Mission, respectively), there has been less focus on the application to power units. Beginning in 2012, an effort was started by the Marshall Space Flight Center (MSFC) on the APU application.

The MSFC plan was to demonstrate green propellants with residual Space Shuttle hardware. The principal investigator was able to acquire a Solid Rocket Booster gas generator and an Orbiter APU. Since these test assets were limited in number, an Air Force equivalent asset was identified: the F-16 Emergency Power Unit (EPU). In June 2013, two EPU’s were acquired from retired aircraft located at Davis Monthan Air Force Base. A gas generator from one of these EPU’s was taken out of an assembly and configured for testing with a version of the USAF propellant with a higher water content (AF-M315EM) to reduce decomposition temperatures. Testing in November 2014 has shown that this green propellant is reactive with the Hydrazine catalyst (Shell 405) generating 300 psi of pressure with the existing F-16 EPU configuration. This paper will highlight the results of MSFC testing in collaboration with AFRL.
