Creep, Fatigue and Fracture Behavior of Environmental Barrier Coating and SiC-SiC Ceramic Matrix Composite Systems: The Role of Environment Effects

Dongming Zhu and Louis J. Ghosn

Materials and Structures Division
NASA Glenn Research Center
Cleveland, Ohio 44135, USA

The 11th International Conference on Ceramic Materials and Components for Energy and Environmental Applications
Vancouver, British Columbia, Canada
June 15-19, 2015
Durable Environmental Barrier Coating Systems for Ceramic Matrix Composites (CMCs):
Enabling Technology for Next Generation Low Emission, High Efficiency and Light-Weight Propulsion

— NASA Environmental barrier coatings (EBCs) development objectives
  • Help achieve future engine temperature and performance goals
  • Ensure system durability – towards prime reliant coatings
  • Establish database, design tools and coating lifing methodologies
  • Improve technology readiness

Fix Wing Subsonic Aircraft
Supersonics Aircraft
NASA Environmental Barrier Coating Development Goals

- Emphasize temperature capability, performance and durability
- Develop innovative coating technologies and life prediction approaches
- 2700°F (1482°C) EBC bond coat technology for supporting next generation
- 2700-3000°F (1482-1650°C) turbine and CMC combustor coatings
  – Meet 1000 hr for subsonic aircraft and 9,000 hr for supersonics/high speed aircraft hot-time life requirements

* Recession: <5 mg/cm² per 1000 hr (40-50 atm, Mach 1-2)

** Component strength and toughness requirements
Outline

- Environmental barrier coating system development: challenges and limitations

- Advanced environmental barrier coating systems (EBCs) for CMC airfoils and combustors
  - NASA EBC systems and material system evolutions
  - Current turbine and combustor EBC coating emphases
  - Advanced EBC development: processing, testing and durability

- Design tool and life prediction perspectives of coated CMC components

- Advanced CMC-EBC rig demonstrations

- Summary and future directions
Fundamental Recession Issues of CMCs and EBCs

- Recession of Si-based Ceramics
  (a) Convective; (b) Convective with film-cooling
  - Low SiO₂ activity EBC system development emphasis
- Advanced rig testing and modeling
  More complex recession behavior of CMC and EBCs in High Pressure Burner Rig

Recession rate = const. \( V^{1/2} \frac{P_{(H₂O)}^2}{(P_{\text{total}})^{1/2}} \)

\[
\text{SiO₂} + 2\text{H₂O}(g) = \text{Si(OH)}₄(g)
\]

SiC/SiC CMC and EBC Recession Kinetics Determined for CMCs-EBCs in High Pressure Bruner Rig and Laser Steam Rig Testing

— Determined recession under complex, and realistic simulated turbine conditions

High temperature recession kinetics for film-cooled and non-film cooled Gen II SiC/SiC CMCs

Examples of environmental barrier coating recession in laboratory simulated turbine engine conditions
Degradation Mechanisms for Si Bond Coat

- Silicon bond coat melts at 1410°C (melting point)
- Fast oxidation rates (forming SiO₂) and high volatility at high temperature
- Low toughness at room temperature (0.8-0.9 MPa m<sup>1/2</sup>; Brittle to Ductile Transition Temperature about 750°C)
- Low strength and high creep rates at high temperatures, leading to coating delamination
- Interface reactions leading to low melting phases
  - A more significant issue when sand deposit Calcium- Magnesium – Alumino-Silicate (CMAS) is present
- Si and SiO₂ volatility at high temperature (with and without moisture)
Degradation Mechanisms for Si Bond Coat – Interface reactions

- Significant interfacial pores and eutectic phases formation due to the water vapor attack and Si diffusion at 1300°C
- Heat flux condition further limit the use temperatures

SEM images Interface reactions at 1300°C; total 200 hot hours

**Challenges overcome by advancements:** Improved phase stability, recession resistance of top coat, Increased phase stability and toughness, Advanced compositions & processing for thinner coatings, higher stability and increased toughness.
Major development milestones:

- **1995-2000:** BSAS/Mullite+BSAS/Si

- **2000-2004:** \( \text{RE}_2\text{Si}_2\text{O}_7 \) or \( \text{RE}_2\text{SiO}_5/\text{BSAS}+\text{Mullite/Si} \)

- **2000-2004 - 3000°F EBC systems:** HfO\(_2\) systems (HfO\(_2\) version four-component low k) / \( \text{RE}_2\text{Si}_2\text{O}_7 \) or \( \text{RE}_2\text{SiO}_5/\text{BSAS}+\text{Mullite/Si} \) and Oxide+Si bond coats; component demonstrations
  - Modified mullite (with transition metal and RE dopants) to replace BSAS+mullite
  - Many compound oxide top coat materials explored

- **2005-2011 - Turbine coating systems:** Multi-component, graded HfO\(_2\)-Rare Earth Oxide-SiO\(_2\)/ multi-component Rare earth Silicate/ HfO\(_2\)-Si systems
  - \( \text{RE}-\text{HfO}_2-\text{X/Multicomponent RE-silicate} / \text{HfO}_2-\text{Si} + \text{X} \) (doped)

- **2009-present:** Improved EBC compositions in progress; RE-Si bond coat
  - \((\text{Gd}, \text{Yb}, \text{Y})\)Si bond coat and top coat
Develop processing capabilities, experience and demonstrate feasibilities in various techniques: air plasma spray, Electron Beam - Physical Vapor Deposition (EB-PVD), Plasma Sprayed-Physical Vapor Deposition (PS-PVD):

- Efforts in developing turbine EBC coatings with Directed Vapor Technologies using Directed Vapor EB-PVD: Turbine Airfoils
- In-house APS, and Triplex Pro APS (with Sulzer/Oerlikon Metco) - for Combustor applications
- Cathodic arc and Magnetron PVD processes: bond coat developments
- In-house PS-PVD
- Some planned EBCs DVM/DVC coatings (with Praxair): aiming at combustor EBC
Environmental Stability of Selected Environmental Barrier Coatings Demonstrated in NASA High Pressure Burner Rig

— EBC stability evaluated on SiC/SiC CMCs in high velocity, high pressure burner rig environment

— Advanced EBC recession met NASA Fundamental Aeronautics Project goals (2011)

Stability of selected coatings systems

Gas pressure 6 atm
Gas velocity 30m/s
Gas velocity 200m/s

Stability and temperature capability improvements through coating composition and architecture innovations

Specific weight change, mg/cm²-h
1/T, K⁻¹
Temperature, °C

Stability of selected coatings systems

SiC, 20m/s, 6 atm; Robinson and Smialek, J. Am. Ceram Soc. 1999;
NASA Turbine Environmental Barrier Coating
Developments - Continued

- Advanced EBC top coats tested in coupons under laser heat flux cyclic rigs up 1700°C
- Coated subelements coating tested up 1500°C under laser thermal gradient for 200 hr
- EBC systems show high stability in High Pressure Burner Rig Tests
- Low thermal conductivity of 1.2 W/m-K for optimized turbine airfoil coatings

High pressure burner rig, 16 atm, 31 hr – no measurable weight loss
Development and Processing of Directed Vapor Electron Beam - Physical Vapor Deposition (EB-PVD)

- NASA programs in supporting processing developments and improvements with Directed Vapor Technologies International, Inc.
  - Multicomponent thermal and environmental barrier coating vapor processing developments
  - High toughness turbine coatings
  - Affordable manufacture of environmental barrier coatings for turbine components
Plasma Sprayed-Physical Vapor Deposition (PS-PVD) Processing of Environmental Barrier Coatings

— Focused on advanced composition and processing developments using state-of-the-art techniques
— Improved processing envelopes using high power and higher velocity, graded systems processing for advanced TEBCs and thermal protection systems

EBCs

Inner and outer liner articles
Plasma Sprayed-Physical Vapor Deposition (PS-PVD)

Processing of Environmental Barrier Coatings

– NASA PS-PVD and PS-TF coating processing using Sulzer newly developed technology
  • High flexibility coating processing – PVD - splat coating processing at low pressure (at ~1 torr)
  • High velocity vapor, non line-of-sight coating processing for complex-shape components
  • Emphasis on fundamental process and powder composition developments for EBC depositions

100 kW power, 1 torr operation pressure

NASA hybrid PS-PVD coater system
Advanced EBC Coating Material Strength Evaluations

- EBC and bond coat constituents are designed with high strength and high toughness to improve coating durability
  - Advanced EBC 150-200 MPa strength achieved at high temperature
  - Multicomponent silicates showed excellent high temperature properties
  - Toughness 3-4 MPa m$^{1/2}$ also achieved (tested at room temperature)
- HfO$_2$-Si based systems showed promising strength and toughness
- More advanced bond coats showed higher temperature capabilities and improved strength

![Graph showing the relationship between strength and temperature for various EBC bond coat constituents.](Image)
NASA EBC Bond Coats for Airfoil and Combustor EBCs

– Advanced systems developed and to improve Technology Readiness Levels (TRL)
– Composition ranges studied mostly from 50 – 80 atomic% silicon
  • PVD-CVD processing, for composition downselects - also helping potentially develop a low cost CVD or laser CVD approach
  • Compositions initially downselected for selected EB-PVD and APS coating composition processing
  • Viable EB-PVD and APS systems downselected and tested; development new PVD-CVD approaches

Understanding High Velocity Gas Flow Interactions – Columnar Structure and Toughness Considerations

- High velocity, high pressure gas impingements and shear force induced erosion in turbine engine flow condition can be of concern for low toughness coating systems
- High toughness, optimum coating density and architectures are required for durability

\[ \tau = \frac{F}{A} = C_D \left( \frac{1}{2} \rho V^2 \right) \]

\[ \sigma = \frac{M c}{I} = \frac{\pi \tau r^2 h r}{\pi r^4} = \frac{4 \tau h}{r} \]

\[ \sigma = \frac{4 h}{r} \left( C_D \frac{p V^2}{2 RT} \right) = \frac{2 h}{r} \left( C_D \frac{p V^2}{R T} \right) \]

For a columnar structure with defect of size \( a \)

\[ K_I = \sigma \sqrt{\pi a} f(a, r) \]

\[ K_I = \frac{2 h}{r} \left( C_D \frac{p V^2}{R T} \right) \sqrt{\frac{\pi a f(a, r)}{r}} \]

Thermal Gradient Tensile Creep Rupture Testing of Advanced Turbine Environmental Barrier Coating SiC/SiC CMCs

- Advanced high stability multi-component hafnia-rare earth silicate based turbine environmental barrier coatings being successfully tested for 1000 hr creep rupture
- EBC-CMC creep, fatigue and environmental interaction is being emphasized
Thermal Gradient Fatigue-Creep Testing of Advanced Turbine Environmental Barrier Coating SiC/SiC CMCs - Continued

- Advanced environmental barrier coatings – Prepreg CMC systems demonstrated long-term EBC-CMC system creep rupture capability at stress level up to 20 ksi at $T_{EBC}$ 2700°F, $T_{CMC}$ interface ~2500°F
- The HfO$_2$-Si bond coat showed excellent durability

EBCs on Gen II CMC after 1000 hr fatigue testing

Hybrid EBCs on Gen II CMC after 100 hr low cycle creep fatigue testing
Fatigue Tests of Advanced RESi Bond Coats and EBC Systems

- Uncoated CMCs, Bond coat/CMC and EBC/Bond Coat/CMC systems tested flexural fatigue tests with 15 Ksi loading
- Heating provided by steady-state laser
- Strength and Fatigue cycles tested
- Fatigue tests at 3 Hz, 2600-2700°F, stress ratio 0.05, surface tension-tension cycles

Achieved long-term fatigue lives (near 500 hr) with EBC at 2700°F
Thermal Gradient Fatigue-Creep Testing of Advanced Turbine Environmental Barrier Coating SiC/SiC CMCs - Continued

- Effects of temperature, load, heat flux and environments (steam and combustion air) for coated SiC/SiC CMC are being investigated
- EBC coated CMCs showed improved durability

Failed; total creep strains 0.7-0.8%

Effects of temperature, load, heat flux and environments (steam and combustion air) for coated SiC/SiC CMC are being investigated
EBC coated CMCs showed improved durability
Advanced HfO$_2$-Si Bond Coats: Effects of Compositions on Strength and Creep Rates

- The HfO$_2$-Si composite coatings showed high strength, and improved creep resistance at high temperatures
- Increased HfO$_2$-HfSiO$_4$ contents improve high temperature strength and creep resistance
EBC-CMC Thermal Gradient Creep Rupture and Delamination Modeling

- An equivalent stress model is established for EBC multicrack stress intensity modeling: emphasize creep, thermal gradient and stress rupture interactions
- Benchmark failure modes established in EBC systems

Stress gradients in Prepreg SiC/SiC CMC substrates under thermal gradient + mechanical creep loading
EBC-CMC Thermal Gradient Creep Rupture and Delamination Modeling - Continued

- An equivalent stress model is established for EBC multicrack stress intensity modeling: emphasize creep, thermal gradient and stress rupture interactions
- Benchmark failure modes established in EBC systems

Finite Element Analysis (FEA) Modeling
EBC-CMC Thermal Gradient Creep Rupture and Delamination Modeling – Bond Coat Stiffness Effect

- Delamination driving forces: uniform remote applied stress case, 0.300 mm thickness coating with ~ 0.06% total strain
- Effect of bond coat elastic modulus: E=150 GPa vs. E=50 GPa
- Strong bond coats expected to have less creep damage (lower strain energy release rate $G$ for strong bond coats)

---

**Graphs:**

- Solid Lines: strong bond coat
  - E=150 GPa EBC
  - E=150 GPa bond coat
- Dashed Lines: Soft bond coat
  - E=150 GPa
  - E=50 GPa

**Equation:**

$G \approx \frac{K^2}{E}$
Advanced EBCs designed with higher strength and stiffness to improve creep, fatigue, and cyclic durability
The Advanced EBC on SiC/SiC CMC Turbine Airfoils Successfully Tested for Rig Durability in NASA High Pressure Burner Rig

- NASA advanced EBC coated turbine vane subcomponents tested in rig simulated engine environments (up to 240 m/s gas velocity, 10 atm), reaching TRL of 5
- Turbine EBCs generally intact (some minor partial coating top coat spalling for the Prepreg MI SiC/SiC vane)
- Some minor CMC vane degradations after the testing

EBC Coated CVI SiC/SiC vane after 31 hour testing at 2500°F+ coating temperature
EBC Coated Prepreg SiC/SiC vane after 21 hour testing at 2500°F
EBC Coated Prepreg SiC/SiC vane tested 75 hour testing at 2650°F

Uncoated vane tested 15 hr
The EBC Coated SiC/SiC CMC Combustor Liner Successfully Demonstrated for Rig Durability in NASA High Pressure Burner Rig (First Inner Liner Processed at Sulzer with Triplex Pro)

- Tested pressures at 500 psi external for outliner, and up to 220 psi inner liners in the combustion chamber (16 atm), accumulated 250 hours in the high pressure burner rig
- Average gas temperatures at 3000°F (1650°C) based on CEA calculations, the liner EBCs tested at 2500°F (1371°C) with heat fluxes 20-35 W/cm², and the CMC liner component at 1800-2100°F (~1000-1100°C)

![Graph showing Ideal Flame Temperature Calculation - Chemical Equilibrium Analysis Codes (CEA)-II](image)

- Hot streaks with possible gas temperature over 2000°C, with minimum back cooling
- Swirl jet flows
- Some minor coating spalling at hot streak impingement
Summary

• Durable EBCs are critical to emerging SiC/SiC CMC component technologies
  — The EBC development built on a solid foundation from past experience, evolved with the current state of the art compositions of higher temperature capabilities and stabilities
    — Multicomponent EBC oxide/silicates
    — RE-Si bond coat
  — Advanced EBC processing and testing capabilities significantly improved, helping more advanced coatings to be realized for complex turbine components
  — Better understood the coating failure mechanisms, and helping developing coating property databases and life models, aiming at developing higher stability, higher strength EBC and bond coats
  — Emphasized thin coating turbine and combustor EBC coating configurations, demonstrated component EBC technologies in simulated engine environments – TRL 5
Future Directions and Opportunities

• High stability turbine airfoil and combustor coating system development continues to be a high priority
  – Advanced composition development, optimization, down-select a EBC coating System(s)
  – Reduce recession rates, improve the temperature stability and complex environment resistance, such as in CMAS environments
  – Low thermal conductivity

• Advanced environmental barrier coatings with significantly improved thermal and mechanical load capability
  – Emphasize coating strength and toughness
  – Better understand and improve creep, fatigue, and environment interactions
  – Design and demonstrate long-term high heat flux cyclic stability

• Materials and component system integration
  – Develop robust and economical processing capabilities
  – Optimize and validate coatings with more complex sub-elements and components

• Laboratory simulated high heat flux stress, environment testing and life prediction methodology development, validating model developments
