Mosquito-borne Disease Ecology

- Annually ~96 million cases of disease worldwide
- Endogenous transmission in Florida + Texas
- Symptoms: muscle and bone ache, fever, and hemorrhagic manifestations in rare cases
- 4 serotypes of virus
Environment - Vector - Virus Connections

- Positive or Negative
Modeling Dengue Fever in Sonora, Mexico

- Dengue ecology
  - Mosquito population dynamics
  - Virus transmission dynamics
- *Aedes aegypti* mosquitoes
  - Urban, container breeding
  - Live in tropical habitats
  - Anthropophilic
- Sonora Mexico
  - Arid climate
  - Monsoon precipitation
  - Seasonal cycles of dengue transmission
  - Large annual variations in epidemics

Data and Methods

• Study area
  • 4 sites in Sonora, Mexico

• Meteorological/Dengue case data
  • Daily maximum and minimum temperatures (NLDAS)
  • Daily precipitation (TRMM, NLDAS)
  • Weekly suspected dengue cases by city 2006-2011

• Model
  • Parameterized for *Aedes aegypti* mosquitoes, daily time step
  • Run from 2005-2011 under varying parameters (500)
  • Best 3% of runs chosen by comparison with suspected case data (R^2)
Model Parameter Estimation

- **Containers**
  - Based on household surveys (Hermosillo)
  - Human managed and open containers
  - Used mean values and +/- 25% and 50%

- **Minimum infectious rate**
  - Minimum amount of infectious humans
  - Maintains virus within the population
  - Based on case data and previous study in San Juan, PR

- **Maximum larval density**
  - Used to calculate density-dependent mortality
  - Based on observations, literature, and previous study in San Juan, PR
Modeling *Aedes aegypti* and Dengue Virus Ecology
Dengue and Climate Comparisons

- Epidemics asynchronous
- Very Similar

Graphs showing Dengue cases, precipitation, max temperature, and min temperature over time.
Climate, Dengue, Simulations: Hermosillo

- 2008 and 2010 are largest dengue years
- Epidemics follow monsoon rains
- Precipitation magnitude not correlated with dengue case incidence
  - Introduction rate is likely important
Climate, Dengue, Simulations: Guaymas

- Dengue is highest in 2010 despite dry conditions
  - Similar to Hermosillo
- Driest city examined
  - Importance of human managed water sources
- Model has difficulty simulating seasons with no peak
  - 2008 + 2011
Climate, Dengue, Simulations: C. Obregon

- Lowest annual variability in dengue cases
- Model has difficulty simulating seasons with no peak
  - 2011
Climate, Dengue, Simulations: Navojoa

- 2008 is highest dengue year
- Dengue transmission is low in 2010
  - Unlike Hermosillo and Guaymas
- Model has difficulty simulating seasons with no peak
  - 2006, 2007, and 2010
Dengue Transmission in Nogales

- Why is there little/no dengue transmission in nearby Nogales?

- Hypothesis: Climate conditions are cooler
  - Suppression of mosquito population
  - Extension of extrinsic incubation period (EIP)

- Experiments:
  - 1: Rerun Hermosillo simulations with Nogales meteorological data
  - 2: Perform experiment 1 with 1°C warming
  - Performed during large epidemic years (2008 and 2010)
Hermosillo/Nogales Comparison: Mosquitoes

- Little/no dengue is simulated under Nogales meteorological conditions
- With warming, there is a modest mosquito population increase in 2008
  - No dengue
- With warming, the mosquito population is higher under Nogales conditions in 2010
  - Results in increased virus transmission
Hermosillo/Nogales Comparison: EIP

- EIP is considerably longer under Nogales conditions.
- Under Nogales conditions, the EIP is longer during the transmission season in 2008:
  - Prevents completion of EIP during mosquito lifetime.
- EIP shortened under 1°C warming conditions:
  - Especially during transmission season.
Challenges in Climate and Health Research

- Reporting problems
  - Misdiagnosis
  - Subclinical cases
  - Reporting errors/bias
  - Availability of data

- Knowledge gaps
  - Incubation periods
  - Transmission probabilities
  - Evolution and adaption of virus and human immunity

- Human vs. climate influences
  - Socioeconomic status
  - Microclimatic influences
  - Human adaptions to climate
Conclusions

• Nearby locations can exhibit very different patterns of dengue transmission
  • Differences in virus introduction
  • Small climatic differences can make large differences

• Dengue epidemics follows monsoon rains
  • Timing is consistent, however, the magnitude is not well correlated

• Climate is an important regulator of dengue transmission in Nogales
  • Affects mosquito population dynamics and the virus incubation period
  • Year to year variability is important

• Dengue transmission dynamics in northern Mexico may affect dengue risk in the United States
  • Travel, climate change
  • Recent dengue epidemic in Nogales
Next Steps

• Run model for additional locations along US/Mexico border
  • Does transmission vary?
  • Why?
• Perform fine scaled model runs
  • How does risk vary within a city?
• Consider socioeconomic conditions in model
