11th International Conference on Ceramic Materials and Components for Energy and Environmental Applications
Vancouver, B.C., Canada
June 18, 2015
Environmental Barrier Coatings for Ceramic Matrix Composites

- Improve air-breathing turbine efficiency by replacing metal-based components with ceramic matrix composites (CMCs)
- Environmental barrier coatings (EBCs) protect CMC components from oxidation and corrosion in hot section of gas turbine engines
  - Rare-earth silicates

Target: 1482°C

Molten CMAS Damage to Protective Coatings

- Particulates (i.e. sand, volcanic ash) ingested by engine melt into Calcium-Magnesium-AluminoSilicate (CMAS) glass above 1200ºC
- Molten CMAS degrade EBCs

➢ Need EBC materials resistant to CMAS glass attack above >1200ºC

High-Temperature Interactions between EBC Material and CMAS Glass

Objective:

• Evaluate thermo-chemical interactions between yttrium disilicate ($Y_2Si_2O_7$) EBC material and a desert sand glass at temperatures 1200ºC-1500ºC

• **Yttrium Disilicate ($Y_2Si_2O_7$)**
  – Comparable coefficient of thermal expansion to silicon-based CMCs
  – Water vapor resistance

• **Desert Sand (CMAS) Glass**
  – Actual sand sample
  – Relevant CMAS composition to aviation

---

Aircraft engine ingests sand upon take-off
Preparation of Desert Sand Glass

• As-received desert sand melted into glass
  – Heated at 10°C/min to 1550°C (1h)
  – Quenched melt in water
  – Grind glass frit in planetary mill using zirconia milling media
  – Pass through sieve (<297 µm)

• Chemical analysis of glass by inductively coupled plasma atomic emission spectrometry (ICP-AES)

Desert sand glass comprised of CMAS and trace oxides

Evaluate sand (CMAS) glass interactions with $Y_2Si_2O_7$ material

- **CMAS glass on hot-pressed $Y_2Si_2O_7$ substrate**
  - Load substrate with CMAS glass $\sim 35 \text{ mg/cm}^2$
  - 20h heat treatments at $1200^\circ\text{C}$, $1300^\circ\text{C}$, $1400^\circ\text{C}$ and $1500^\circ\text{C}$ in air
  - Evaluate microstructure and composition of $Y_2Si_2O_7$/CMAS glass interface with SEM/EDS and EPMA

- **Cold-pressed pellet of $Y_2Si_2O_7$ and CMAS glass**
  - 80 wt.% $Y_2Si_2O_7$, 20 wt.% CMAS glass
  - 20h heat treatments at $1200^\circ\text{C}$, $1300^\circ\text{C}$, $1400^\circ\text{C}$ and $1500^\circ\text{C}$ in air
  - Analyze resulting phases using XRD
CMAS Glass on $\text{Y}_2\text{Si}_2\text{O}_7$ Substrate

Heat $>1200^\circ\text{C}$, CMAS glass melts and penetrates/reacts with $\text{Y}_2\text{Si}_2\text{O}_7$ substrate

1. CMAS glass infiltration into $\text{Y}_2\text{Si}_2\text{O}_7$ substrate
2. Thermo-chemical interactions of $\text{Y}_2\text{Si}_2\text{O}_7$/CMAS glass
SEM Cross-Section of CMAS/Y$_2$Si$_2$O$_7$ substrate

- Scanning electron microscopy (SEM) to evaluate cross-sections of heat treated CMAS glass/Y$_2$Si$_2$O$_7$ substrates

Interface between Y$_2$Si$_2$O$_7$ substrate/CMAS glass after heat treatment
SEM Cross-Section of CMAS/Y$_2$Si$_2$O$_7$ substrate

- CMAS glass penetration into Y$_2$Si$_2$O$_7$ substrates
  - Infiltration depth increases with temperature

Alternate phase
EDS Mapping of Interaction Region

• Yttrium incorporated into CMAS glass
  – Yttrium signal detected above substrate surface in glass
  – \( \text{Ca}_2\text{Y}_8(\text{SiO}_4)_6\text{O}_2 \) oxyapatite silicate phase expected

• Calcium infiltrated \( \text{Y}_2\text{Si}_2\text{O}_7 \) substrate
  – Depth of calcium infiltration corresponds to microstructural deformation in interaction region

Interface between \( \text{Y}_2\text{Si}_2\text{O}_7 \) substrate and CMAS glass after 20h heat treatment at 1500\(^{\circ}\)C
Quantification of Composition by EPMA

- Electron probe micro-analysis (EPMA)
  - Evaluate composition along line normal to substrate surface

BSE image of $Y_2Si_2O_7$ substrate and CMAS glass after 20h heat treatment at 1500ºC
Quantification of Composition by EPMA

- Electron probe micro-analysis (EPMA)
  - Evaluate composition along line normal to substrate surface
  - Quantify variation in elemental composition from CMAS glass through $\text{Y}_2\text{Si}_2\text{O}_7$ substrate after various heat treatments

- Ca detected throughout CMAS glass and interaction region
- No Ca in substrate
- Minimal Al or Mg in interaction region

Compare Ca content in specimens heat treated at different temperatures

![Graph showing concentration vs. distance with peaks for Y, Ca, Al, and Mg]
Average CaO Content by EPMA

- CaO content in glass decreases with temperature
- CaO content in interaction region constant
  - Depth of interaction region increases with temperature
- No CaO detected in substrate
Identifying Alternate Phase using XRD

- Heat treat powder pellets containing 80 wt.% EBC powder ($Y_2Si_2O_7$) and 20 wt.% CMAS glass
- Evaluate reacted pellet using X-ray diffraction (XRD)

**Alternate phase:** $Ca_2Y_8(SiO_4)_6O_2$ oxyapatite silicate phase

![Diagram showing normalized intensity vs. position [°2θ] (Copper) before and after heat treatment.](image-url)
Conclusions and Current Efforts

- Desert sand (CMAS) glass reacted with $Y_2Si_2O_7$ yielding $Ca_2Y_8(SiO_4)_6O_2$ oxyapatite silicate phase
  - Formed by dissolution of $Y_2Si_2O_7$ in CMAS glass followed by precipitation during cooling
  - Similar reaction observed for $Y_2SiO_5$

- Depth of CMAS infiltration increased with increasing heat treatment temperature
  - More significant pore formation and microstructural deformation in interaction region compared with $Y_2SiO_5$

- Evaluate other advanced EBC materials’ high-temperature interaction with desert sand (CMAS) glass
