Ravi Rajamure - Cleveland State University
Richard N. Grugel – NASA-MSFC
MICAST
A NASA and European Space Agency (ESA) Collaboration:
Microstructure Formation in Castings of Technical Alloys under Diffusive and Magnetically Controlled Convective Conditions

- A systematic analysis of the effect of convection on the microstructural evolution in the directional solidification (DS) of engineering alloys.

- Experiments are carried out under well defined processing conditions.

- Sample analysis conducted using advanced diagnostics and theoretical modeling.
Previous Investigation
Al-26.5 wt. % Cu: Primary dendrite arm spacing increases in microgravity

30 K cm\(^{-1}\), 4.2 \(\mu m \) s\(^{-1}\)

25 K cm\(^{-1}\), 4.2 \(\mu m \) s\(^{-1}\)

30 K cm\(^{-1}\), 4.2 \(\mu m \) s\(^{-1}\)

Terrestrial: Solutally unstable
Primary spacing = 450 ± 20 \(\mu m\)

Terrestrial: Solutally stable
340 ± 10 \(\mu m\)

Microgravity
1540 ± 10 \(\mu m\)

Microgravity Processing

- Rods of Al-7Si cast at Alcoa Technical Center
- DS-ed at CSU to obtain aligned dendritic structure
  - <100> parallel to axis
- Precision machined and shipped to ESA-contractor
- Inserted into alumina “crucible-molds”
- Put into Sample-Cartridge-Assembly (SCA)
Expectations:
Solidification Processing in a Microgravity Environment

Advantages: Mitigate Thermo-Solutal Convection

Intent: DS Samples under Diffusion-Controlled Conditions that are Free of Macrosegregation

Purpose: Better Understand the Relationship between Processing and Microstructural Development

Application: Benchmark measurements applicable to modeling efforts, improve ground-based processing
Comparison of ISS and Ground-based Experiments

MICAST6 / 6Ground
• DS growth rate increase (5 µm s\(^{-1}\) to 50 µm s\(^{-1}\))
• Temperature gradient: \(~20\) K/cm

MICAST7 / 7Ground
• DS growth rate decrease (20 µm s\(^{-1}\) to 11 µm s\(^{-1}\))
• Temperature gradient: \(~26\) K/cm

(MICAST12, Constant growth rate is currently being evaluated)
Microstructural Comparison: Earth and Microgravity

Terrestrial:
Al – 7wt.% Si
$G = 15$ K cm$^{-1}$

$V = 5$ μm s$^{-1}$

$V = 50$ μm s$^{-1}$
MICAST6: Al – 7wt.% Si
$G = 20 \text{ K cm}^{-1}$

$V = 5 \mu\text{m/s}$

$V = 50 \mu\text{m/s}$

- Based on diffusion in the liquid around the dendrite tip.
- Calculates PDAS assuming no convection in the liquid.
- Physical constants for Al-7Si are well known.
- Final Equation: \( \lambda' = 0.15596 V' (a - 0.75) (V' - G')^{0.75} (G')^{-0.6028} \)
- Calculates the spacing as the tip-to-tip spacing.

MICAST6- Primary Dendrite Arm Spacing

MICAST6G- Primary Dendrite Arm Spacing
MICAST7- Primary Dendrite Arm Spacing

Separation may result in Marangoni convection in the liquid during DS at 60mm mark.
Marangoni Convection Effect - Continued

118.1 mm from the seed

149.4 mm from the seed
MICAST7G- Primary Dendrite Arm Spacing

![Graph showing Primary Dendrite Arm Spacing](image)
Conclusions

• The primary dendrite spacing increased in microgravity.

• The “array stability limit” of the Hunt and Lu model successfully predicted dendrite arm spacing.
  → Based on nearest-neighbor spacing measurements.

• Comparison of the results implies that dendrite arm spacings respond quicker to growth rate changes in \( \mu g \) than on the ground

• Separation was observed between the crucible and alloy in the ISS sample.
  → Presumed Marangoni convection disrupts steady-state dendrite growth.
Acknowledgments

• This grant has been supported by NASA Grant NNX08AN49G.

• Prof. R.G. Erdmann at The University of Arizona.

• NASA-MSFC assisted immensely in coordinating with ESA, real-time communications during the space experiments, and arranging for return of the ISS-processed samples to earth.

• Dr. Men G. Chu at the ALCOA Technical Center for preparing the alloys.
