CubeSat Constellation Cloud Winds (C3Winds)

A New Wind Observing System to Study Mesoscale Cloud Dynamics and Processes

Marv and UARS Winds

• Upper Atmosphere Research Satellite (UARS)
  – Dynamics Working Group (Chair)
  – Theoretical Modelling Investigations of Dynamics for UARS (PI)

• High Resolution Doppler Imager (HRDI)
  – Strong tidal winds in the MLT region
  – Gravity wave (GW) – tides interactions
Gravity Waves from UARS MLS

Wu and Waters (1996)
Challenges to Measure Winds from Space

- **UARS/HRDI**
  - Airglow emission (upper atmos)
  - Airglow scattering-absorption (lower atmos)

- **UARS/WINDII**
  - Airglow emission (upper atmos)

- **Aura/MLS**
  - O$_2$ microwave emission (mid atmos)

- **ISS/SMILES**
  - O$_3$ and HCl microwave emissions (mid atmos)
Mid-Atmospheric Winds after UARS

Wu et al. (2008)
- Aura/MLS 118-GHz Zeeman-split O\textsubscript{2} limb emission
- 0.1 MHz spectral resolution
- Improved receiver sensitivity
- Along-track wind only

Baron et al. (2013)
- O\textsubscript{3} and HCl limb emissions at 35-80 km
- 1.2 MHz spectral resolution
- High sensitivity at cryogenic (4K) temperature
- One-component wind from ISS
Thermospheric Winds from 2.06-THz OI Emission

Yee et al. (2015)

- 2.06-THz atomic oxygen (OI) limb emission
- 1-2 MHz spectral resolution
- Receiver sensitivity $T_{sys} (DSB) = 7000$ K
- Useful wind profile at 100-140km
Atmospheric Motion Vectors (AMVs)

• Operation algorithms:
  – Feature selection (e.g. contrast test, multi-layer cloud discrimination)
  – Height assignment
  – Feature tracking
  – Quality control

• Geo-registration of images with landmark; Triplet set of images for pattern matching

• Where are the data gaps?
  – Fast, dynamic regions
  – Strong vertical wind shear
  – Dry atmosphere and night
Multi-angle Imaging SpectroRadiometer (MISR) on Terra

von Kármán vortex street near Jan Mayen Island
Complexities of Tropospheric Winds and Thermodynamics

**Severe Weather**

- Extratropical cyclones (ETC)
- Tropopause folding
- Low-level “sting jets”

**MODIS**

- Dynamic structures of ETCs in severe wind events?
- Variability of ETCs and tropopause folds?
- Predictability of severe weather events and processes?

**MISR CTH and Winds**

- Strong Surface Winds
- Stratospheric Intrusion
## Limitations of Current AMVs

CubeSat Constellation Cloud Winds (C3Winds)
Multi-platform Multi-angle Imaging

An Earth Venture-Instrument Proposal to NASA
C3Winds formation flight, designed for a nominal 500-km orbit to employ stereoscopic imaging with two CubeSats separated by 5-10 min in time, is extremely flexible to accommodate considerable variations in orbit.

Orbit: ISS (1st priority)
LRD: 2019
Operation: 2020-2021

C3Winds Science Objectives

Transforming the stereo cloud imaging technique to make accurate wind velocity and height measurements from space for improving severe weather prediction.

- Measure the high-resolution 3D wind fields, with good height and speed accuracy.
- Characterize and understand the ETC and TC dynamic structures.
- Demonstrate near-real-time (<3 hours) wind observations and impacts of high-res winds on severe weather prediction.
- Provide synergistic wind observations with GOES-R and Himawari.

Primary Target of C3Wind Obs.

RMS Difference (ms⁻¹) in 300-hPa Wind Speed Analyses Produced by ECWMF and the NCEP GFS

Secondary Targets of C3Wind Obs.

Langland and Maue (2012)
Summary

- Winds are the key observable in characterize Earth’s climate and weather systems, and yet remain challenging to measure accurately.

- Advances in GHz and THz technologies have allowed useful wind measurements in the mid-and-upper atmosphere during day and night.

- ~70% of global tropospheric winds can be obtained by tracking cloud and water vapor features, and multi-platform multi-angle imagers can significantly improve wind/height accuracy.
