The Orbital Debris Problem

J.-C. Liou, PhD
NASA Chief Scientist for Orbital Debris

Space Tech Conference
Pasadena, California, 24-26 May 2016
Outline

• **Overview of the orbital debris problem**
  – What is orbital debris
  – Danger of orbital debris

• **Orbital debris mitigation policy**
  – NASA
  – U.S. Government
  – International community (IADC and United Nations)

• **Challenges for orbital debris environment management**
Overview of the Orbital Debris Problem
What Is Orbital Debris?

- Orbital debris is any human-made object in orbit about the Earth that no longer serves any useful purpose.
Historical Orbital Debris Environment

- Only objects in the U.S. Space Surveillance Network (SSN) catalog are shown
- Sizes of the dots are not to scale
How Much Junk Is Currently Up There?

- Due to high impact speed in space (~10 km/sec in LEO), even sub-millimeter debris pose a realistic threat to human spaceflight and robotic missions
  - 10 km/sec = 22,000 miles per hour (the speed of a bullet ~1,500 miles per hour)
- Total mass: >7000 tons LEO-to-GEO (~2700 tons in LEO)

**Softball size or larger (≥10 cm): ~23,000**
(tracked by U.S. Joint Space Operations Center, JSpOC)

**Marble size or larger (≥1 cm): ~500,000**

**Dot or larger (≥1 mm): >100,000,000**
(a grain of salt)
• JSpOC is tracking ~23,000 large objects and maintains most of their orbits in the U.S. Satellite Catalog.

Growth of the Cataloged Populations

Collision of Cosmos 2251 and Iridium 33

Destruction of Fengyun-1C

~1300 are operational
The material mass in Earth orbit continues to increase and has exceeded 7000 metric tons.
• **Examples of the threat from orbital debris**
  
  – The gravity-gradient boom of an operational French satellite (CERISE) was cut in half by a tracked debris fragment in 1996
  
  – The fully operational Iridium 33 was destroyed by a retired Russian satellite (Cosmos 2251) in 2009
  
  – Near the end of the Space Shuttle Program, the Loss of Crew and Vehicle risks from MMOD impact damage were in the range of 1-in-250 to 1-in-300 per mission (OD to MM ~2:1 at ISS altitude)
  
  – Satellite operators, including the International Space Station (ISS) Program, conduct collision avoidance maneuvers against the tracked objects on a regular basis
    • The ISS carried out four debris collision avoidance maneuvers and one “shelter-in-Soyuz” in 2015
  
  – Impacts by small, untracked debris could be responsible for many satellite anomalies
Orbital Debris Mitigation Policy
Orbital Debris Environment Management

• “Prevention is better than cure”
  – (Prov.) It is better to try to keep a bad thing from happening than it is to fix the bad thing once it has happened.

• “An ounce of prevention is worth a pound of cure”
  – (Prov.) It is better/cheaper to stop something bad happening than it is to deal with it after it has happened.

• Orbital Debris Mitigation (“Prevention”)
  – To prevent the generation of new and long-lived orbital debris in the environment.

• Orbital Debris Remediation (“Cure”)
  – Active removal of orbital debris already exists in the current environment.
• The ODPO is the only organization in the U.S. Government conducting a full range of research on orbital debris
  – This unique NASA capability was established at JSC in 1979 (D. Kessler, B. Cour-Palais, H. Zook, etc.)
  – ODPO’s roles and responsibilities are defined in NPR 8715.6
  – ODPO is currently funded through HQ/OSMA

• ODPO provides technical and policy level support to NASA HQ, OSTP, other U.S. Government agencies and the commercial sector

• ODPO represents the U.S. Government in international fora, including the Inter-Agency Space Debris Coordination Committee (IADC) and the United Nations

• ODPO is recognized as the world leader in environment definition and modeling, and in mitigation policy development
End-to-End Orbital Debris Activities at ODPO

**Measurements**
- Radar
- Optical
- In-situ
- Laboratory

**Modeling**
- Breakup
- Engineering
- Evolutionary
- Reentry

**Environment Management**
- Mitigation
- Remediation
- Policy
- Mission Requirements

**Coordination**
- U.S. Government
- IADC
- United Nations

**Risk Assessment**
- Space assets
  (ISS, Orion, etc)
- Reentry
Orbital Debris Mitigation at NASA

• NASA was the first organization in the world to develop orbital debris mitigation policy and guidelines in the 1990s
  – NASA Management Instruction (NMI) 1700.8 “Policy for Limiting Orbital Debris Generation” was established in 1993

• The current NASA orbital debris mitigation policy is documented in NASA Procedural Requirements for Limiting Orbital Debris, NPR 8715.6 (2007)
• NASA and DOD led the effort to establish the **U.S. Government (USG) Orbital Debris Mitigation Standard Practices** (approved in 2001)

• The U.S. National Space Policies of 2006 and 2010 direct agencies and departments to implement the USG Orbital Debris Mitigation Standard Practices
The IADC is an international forum of national and multi-national space agencies for the coordination of activities related to space debris.

- Current IADC members: ASI, CNES, CNSA, CSA, DLR, ESA, ISRO, JAXA, KARI, NASA, ROSCOSMOS, SSAU, and UKSA.
- NASA represents the U.S. Government to the IADC. The NASA delegation also includes representatives from State, OSD, AF, FAA, and FCC.

IADC is recognized as the technical authority on orbital debris by the international space community.

The IADC developed the first consensus on international orbital debris mitigation guidelines in October 2002; subsequently submitted to the United Nations.
Orbital Debris at the United Nations (UN)

- Orbital debris has been on the agenda of the Scientific and Technical Subcommittee (STSC) of the UN Committee on the Peaceful Uses of Outer Space (COPUOS) since 1994.
- STSC Member States adopted a set of space debris mitigation guidelines similar to the IADC guidelines in Feb. 2007, followed by adoption by COPUOS in Jun. 2007 and by the full UN General Assembly in Dec. 2007.
- There is an on-going effort by COPUOS to develop a new set of guidelines on the long-term sustainability of outer space activities.
Challenges for Orbital Debris Environment Management
Orbital debris has been included in all U.S. national space policies since 1988

Orbital debris removal was mentioned for the first time in the 2010 U.S. National Space Policy

Preserving the Space Environment and the Responsible Use of Space

Preserve the Space Environment. For the purposes of minimizing debris and preserving the space environment for the responsible, peaceful, and safe use of all users, the United States shall:

• Lead the continued development and adoption of international and industry standards and policies to minimize debris, such as the United Nations Space Debris Mitigation Guidelines;
• …
• Pursue research and development of technologies and techniques, through the Administrator of the National Aeronautics and Space Administration (NASA) and the Secretary of Defense, to mitigate and remove on-orbit debris, reduce hazards, and increase understanding of the current and future debris environment; and
• …

(page 7, 2010 U.S. National Space Policy)
Forward Challenges

• Improve compliance with the existing orbital debris mitigation policy, requirements, and guidelines at NASA, in the United States, and by the international space community

• Develop near- and long-term cost-effective orbital debris mitigation and remediation strategies

• Advance space situational awareness coverage

• Explore options for space traffic management
Preserving the Near-Earth Space Environment for Future Generations
