NASA, Astronaut Occupational Surveillance Program and Lifetime Surveillance of Astronaut Health, LSAH: Astronaut Exposures and Risk in the Terrestrial and Spaceflight Environment

Sean Keprta, MS CIH, Occupational Health Officer, Associate Division Chief, Space Medicine and Clinical Operations, Johnson Space Center, National Aeronautics and Space Administration

Dr. William Tarver, Mary Van Baalen PhD, Torin McCoy, Johnson Space Center, National Aeronautics and Space Administration
This presentation represents the efforts of a large number of very dedicated Health and Engineering professionals over many years at NASA and the Johnson Space Center.
Overview

→ **Background** Organizations responsible for Astronaut Health,
  
  – Human Exploration and Operations Directorate, HEOMD, NASA Johnson Space Center, Human Health and Performance Directorate, HHPD, Human Research Program HRP,

→ **NASA Astronaut Corp**
  
  – Flight Operations Directorate

→ **Early Astronaut Medical Care and Surveillance, Longitudinal Surveillance of Astronaut Health LSAH**
  
  – Early mission and focus
  – Mission Operations Philosophy
  – Shuttle Years and Retirement, time for change....

→ **Changes to Lifetime Surveillance of Astronaut Health, LSAH New Focus and Direction**
  
  – International Space Station ISS era
  – Outside Orgs, ASAP, IOM,
  – Benchmarking DOD, NIOSH

→ **Astronaut Occupational Health Program AOHP Occupational Medicine, Risk System/Human System Risk Board**
  
  – Astronaut Occupational Health Management Group
  – LSAH Advisory Board
  – OHMG
  – Astronaut Corp (Similar Exposure Group)

→ **The Workplace Environment**
  
  – Terrestrial
  – Space
Organizations
Organizations

Human Research Program (HRP)
- Director: William H. Patabki, Ph.D.
- Deputy Director: Barbara J. Corbin
- Chief Scientific Officer: John S. Charles, Ph.D.
- Deputy Chief Scientist: Steven A. Pogorely, Ph.D.
- Associate Chief Scientist: International Collaborations: Romulo L. Chornicki, Ph.D., "
- Program Clinician: U.S.
- Operations Representative: Richard M. Linner, DVM

Program Business Management
Manager: Gregory J. Schuster

Program Science Management
Manager: Michelle H. Perkins

TSS Medical Projects (TSSMP)

Early Programs
Astronaut Surveillance

→ Longitudinal Surveillance of Astronaut Health (LSAH) I 1959-1989
→ Longitudinal/Lifetime Surveillance of Astronaut Health LSAH II 1992-2009
→ AOHP 2012- NASA Astronaut Occupational Surveillance Program, Lifetime Surveillance of Astronaut Health

Pathways to Progress

May 21-26, 2016  #AIHce16  AIHce2016.org
Longitudinal Study of Astronaut Health

LSAH
→ Phase 1
→ Phase 2
→ Workforce controls for comparison
→ Low Statistical Power
→ No Consent
LSAH Challenges

→ **Standard issues with space biomedical research**
  - Small n, competing priorities in flight, lack of consistent data, etc.
→ **Healthy Worker Effect: observation that employed populations tend to have a lower mortality experience than the general population.**
  - Likely exacerbated in extremely fit worker populations such as military, firefighters, and the astronaut corps
    o Rigorous selection criteria
    o Specialized medical care provided by NASA
      o Frequent, more comprehensive screenings than those available to the public
      o Incentives for health maintenance not available to the general public
    o Educational level
→ **Further illustrates the need for an appropriate control population**
The end of the Shuttle Program

Rex J. Walheim
Time for Change NEW LSAH

→ For Human Spaceflight, NASA acts as;
  – NORA
  – NIOSH
  – OSHA
  – Employer

For the astronauts
External Program Reviews

Committee on Aerospace Medicine and the Medicine of Extreme Environments (CAMMEE)
Institute of Medicine Recommendations for Human Spaceflight

1. Must serve two sometimes conflicting goals of research and occupational surveillance...

2. No comparison group can meet every goal or need, it should be individualized...

3. Increase the quality and quantity of preventive care to increase the data...

4. NASA should assume responsibility for the lifelong health care of its active and former astronauts.
Additional Drivers for an Astronaut Occupational Surveillance Program

→ **Legal obligation**

→ **Ethical obligation to protect our Astronauts workforce**
  - Space related medical outcomes may manifest beyond current workers compensation statutes.
Why Change Now?

→ Spaceflight paradigm shift - Shuttle Retirement, ISS construction completed and into full operations

→ ISS, Emphasis on long duration habitation

→ External Reviews and findings of NASA Astronaut Health and Human Research programs

• Integration of evolving medical evidence base into requirements development (vehicles, design reference missions, spacesuits, habitats) for exploration missions

• How does astronaut surveillance compare to what we have to do for JSC employees, how is it different???
What is the Astronaut Occupational Health Surveillance Program (AOHP)?

- AOHP is a comprehensive program to monitor health outcomes due to the health risks of workplace exposures and develop strategies to best protect the astronaut.

- The modified strategy is more in line with traditional occupational surveillance with additional considerations for the unique environment.
Astronaut Occupational Health Program

Astronaut Occupational Health Program:
Primary responsibility for policy and decision-making, recommendations for requirements/standards/causation determination

Astronaut Medical Services:
Primary responsibility for implementing all elements of astronaut ‘clinical’ care from selection through retirement.

Lifetime Surveillance of Astronaut Health:
Primary responsibility for data integrity and management, and building and disseminating clinical evidence base.

Occupational Health Management:
Integration??
Primary responsibility for integration within and external to Occ HL, such as HRP, ISSPO, other elements of HEOMD.
AOHP Goals

- Goal 1: Develop and Provide a Comprehensive Annual Medical Exam for each LSAH Participant
- Goal 2: Conduct Occupational Surveillance
- Goal 3: Improve Communication, Data Accessibility, Integrity and Storage
- Goal 4: Support Operational and Health Care Analyses
- Goal 5: Support NASA Research Objectives
Healthcare/Exposures

Spaceflight Exposures

Active Astronaut

Retirement

Terrestrial Exposures

Pathways to Pre-NASA Exposures

May 21-26, 2016

#AIHce16

NIOSH 9/17/2012
Astronaut Occupational Health Program

→ Benchmarked off of similar programs in DoD and the Department of Energy
→ Allows insight into long-term sequelae from exposures in the workplace
→ Presented Draft Model to NIOSH
Occupational Surveillance for Astronauts

→ Meets Ethical and Moral obligation
→ Increases data available to research
→ Identifies and prevents exposure related disease
→ Allows feedback into spacecraft design
→ Allows NASA to follow long term health impacts
Similar Exposure Groups SEG

Following the fairly standardized process well known in the industrial environment, the astronauts are considered an SEG. We monitor them as a group, then as specific individuals, based on exposures and other factors, throughout their “NASA” career.

## HMTA Integrated Human System Risk Summary

![Risk Summary Table](image)

### Pathways to Progress

**May 21-26, 2016**

#AIHce16  
AIHce2016.org
The Work Environment
Terrestrial Aircraft Operations
Terrestrial Neutral Buoyancy Lab
Terrestrial Extreme Environments
International Space Station

- Module Length: 167.3 feet (51 meters)
- Truss Length: 357.5 feet (109 meters)
- Solar Array Length: 239.4 feet (73 meters)
- Mass: 924,739 pounds (419,455 kilograms)
- Habitable Volume: 13,696 cubic feet (388 cubic meters)
- Pressurized Volume: 32,333 cubic feet (916 cubic meters)
- Power Generation: 8 solar arrays = 84 kilowatts

More than 100 telephone-booth-sized rack facilities can be in the ISS for operating the spacecraft systems and research experiments.

The ISS is almost four times as large as the Russian space station Mir and about five times as large as the U.S. Skylab.

In the International Space Station’s U.S. segment alone, 1.5 million lines of flight software code run on 44 computers communicating via 100 data networks transferring 400,000 signals

U.S. control computers have 1.5 gigabytes of total storage, compared to modern PCs, which have ~500 gigabyte hard drives.

The entire 55-foot robot arm assembly is capable of lifting 220,000 pounds, which is the weight of a space shuttle orbiter.
Occupational Hazards in Space

- Microgravity
- Space Adaptation Syndrome
- Circadian Rhythm Disruption
- Radiation of the Space Variety
- Behavioral Health
- Noise
- Chemicals/Carbon Dioxide
- Lasers
- Rocket propellants
- Biological hazards from mice experiment

A Risk Reduction Strategy for Human Space Exploration

Pathways to Progress
May 21-26, 2016
AIHce2016.org
Microgravity Adaptation

Relative to terrestrial normal, the returning de-conditioned, microgravity-adapted crew has:

→ • Hypovolemia –12% to 15% less blood volume (like dehydration)
→ • Anemia –10% to 12% less red blood cells
→ • Neurosensory deconditioning
→ • Aerobic deconditioning –15% to 20% deficit
→ • Decreased strength (postural muscles)
→ • Decreased bone density (postural joints)
→ • Increased spinal length (about 6%; may affect suit fit)
Microgravity Adaptation

• Space Adaptation Syndrome (SAS)
  • Typically experienced in microgravity during first 2-3 days of spaceflight.
  • Nausea, Vomiting, Visual Illusions, Spatial Disorientation, Pallor, Fatigue, Malaise, Cold Sweat
  • Experienced by significant % of crews

• Entry Adaptation Syndrome (EAS)
  • Response to transitioning from microgravity back to 1G
  • Inverse of SAS
  • Similar symptomology and manifestations contribute to dehydration and orthostatic intolerance
  • Experienced by similar percentage of returning crews
Countermeasures

Research

Operational

May 21-26, 2016  #AIHce16  AIHce2016.org
Behavior and Performance

→**Occurrence**
  - All subjected to factors that affect
    - Psychological well-being
    - Interactions with other crewmembers, families, and ground personnel
    - Performance of duties

→**Due to**
  - Mission design
  - Events (9/11; holidays)
  - Spacecraft environment
  - Close quarters

→**Consequences – changes to**
  - Interpersonal environment
  - Safety and productively
  - Team problem solving
  - Decision making
  - Communication
Habitability & Environmental Factors
Nutrition

→ Occurrence
  – All crewmembers to varying degrees, more severe in long-duration missions

→ Due to
  – Changes in sense of taste
  – Limited food choices (currently ~10 day rotation)
  – Scarce fresh fruits/vegetables

→ Consequences
  – Decreased calories eaten and decreased vitamin/mineral intake
  – Performance decrements?
  – Immune, bone, other system impacts
  – Decreased muscle mass
  – Weight loss / dehydration
  – Electrolyte disturbances

→ Countermeasures?
  – Prevention
  – In-flight nutrition questionnaires, pre/in/post-flight tracking
  – Vitamins, supplements
Vehicle Surveillance Capability

Environmental Health System -
- Acoustics: Area Sound Level Meters
- Carbon Dioxide Monitoring
- Compound Specific Analyzers:
  - Oxygen
  - Combustion Products
- Toxicological ‘Grab’ Air Sampling
- Microbial Air & Surface Sampling
- Total Organic Carbon Analyzer
- Water Quality Monitoring
- Active and Passive Radiation Monitoring
- Combustion Products Analyzer
- Formaldehyde Monitoring

Vehicle Systems –
- Atmosphere Control and Supply System (ACS)
- Atmosphere Revitalization System (ARS)
- Internal Thermal Control System (ITCS)
- Passive Thermal Control System (PTCS)
- Regenerative Environmental Control and Life Support System (Regen ECLSS)

Space Radiation

- **Galactic Cosmic Rays (GCR):**
  - highly penetrating protons and heavy ions of extra-solar origin
  - large amounts of secondary radiation
  - largest doses occur during minimum solar activity in an 11-year solar cycle

- **Solar Particle Events (SPE):**
  - medium to high-energy protons
  - occur during maximum solar activity

*Lens limits are intended to prevent early (<5 years) severe cataracts (e.g., from an SPE). An additional cataract risk exists at lower doses from cosmic rays for subclinical cataracts, which may progress to severe types after long latency (>5 years) and are not preventable by existing mitigation measures; they are deemed an acceptable risk to the program, however.  
**Heart doses calculated as average over heart muscle and adjacent arteries.  
***CNS limits should be calculated at the hippocampus.

Archival Water Sample Collection Packets

- TOCA Sample In-flight Analysis Packets
- Iodine Sample In-flight Analysis Packet
- Micro Sample, In-flight Analysis Packets
- Postflight Analysis Packets

- Archive water samples (500 mL) collected prior to vehicle returns
- Allows for comprehensive assessment of water quality
ISS Total Organic Carbon Analyzer (TOCA)

- TOCA measures total organic carbon (TOC) and total inorganic carbon (TIC) in a water sample but does not identify individual contaminants.
- Uses non-dispersive infrared detector to measure CO2 generated during oxidation of organic contaminants.
- U.S. potability limit for TOC < 3.0 mg/L.
- TOC concentrations are typically < 0.3 mg/L.

**Analysis Schedule:**
- Weekly samples from WPA product tank via TOCA hose
- Monthly samples from the Potable Water Dispenser (PWD) collected in sample bags
Colorimetric Water Quality Monitor Kit (CWQMK)

- Provides the capability to measure ionic silver (Ag⁺), molecular iodine (I₂), and total iodine (sum of I⁻, I₂, and I₃⁻) concentrations in water samples on the ISS.
  - Ionic silver – biocide used in RS water systems
  - Molecular iodine – biocide used in US water recovery system
  - Total iodine – monitored at points of crew consumption (medical requirement)
- Monitoring Frequency:
  - Total iodine concentration in US potable water measured quarterly in ambient samples from PWD.
  - Biocide concentrations can be measured to support contingency operations.
**Formaldehyde Badges**

- Formaldehyde Monitoring Kit (FMK)
- Formaldehyde trapped in badge matrix by diffusion
- Typical exposure time is 48 h (in pairs)
- Formaldehyde eluted from badge on the ground and analyzed by spectrophotometry
- Limitation: Sufficient face velocity of air required for best results

**Carbon Dioxide Monitor (CDM)**

- Commercial unit
- 6% upper limit
- 18 h battery life (pump)
- Water & particle filter
- Robust/stable device that uses non-dispersive infrared detector

**Compound Specific Analyzer – Combustion Products (CSA-CP)**

- Commercial unit with electrochemical sensors
- Measures:
  - Carbon Monoxide
  - Hydrogen Chloride
  - Hydrogen Cyanide
  - Oxygen sensors have been removed from current units.
- Post-fire cleanup monitoring
- Mask-doff criteria
- Can be used to investigate sources of combustion products using pump/probe attachment
- Can be zero calibrated in flight

**Archival Air Samples**

- Grab Samples Canisters (GSCs) evacuated and doped on the ground
- Sample collected in <5 seconds (by opening valve)
- 2 samples collected every 45 days
- Returned and analyzed at JSC by GC/FID and GC/MS
- Benefit: Track 100’s of compounds
- Limitation: Reactive compounds are lost
Air Quality Monitor (AQM)

- Periodic measurement of volatile organic compounds in-flight
- Gas Chromatograph-Differential Mobility Spectrometer
- Automated run sequence every ~73 hrs
- 3 year operational life
- Operated in pairs (different GC columns)
- Capable of monitoring 22 target analytes.
