---

**ADR Requirements and Design**

- ADR cools the Soft X-ray Spectrometer microcalorimeter array to 50 mK
- ADR uses a cryogenic system consisting, in part, of a 4.5 K Joule-Thomson (JT) cryocooler and a ~1.3 K superfluid helium tank
- SXS is designed to meet science goals even if there is a failure of the liquid helium or a failure of the JT cryocooler
- ADR has two operating modes
  - **Cryogen mode**: 2-stage ADR cools the detectors, and rejects heat to the liquid helium
  - **Cryogen-free mode**: 3-stage ADR cools the helium tank and detectors, and rejects heat to 4.5 K JT cooler

**Performance Requirements**

**ADR Recycling**

Recycling process optimized for shortest duration
1. Both stages are magnetized to temperature above He tank
2. Heat switches HS1 and HS2 are powered on
3. Both stages are magnetized to full current, flowing heat to He tank
4. HS2 is powered off
5. Stage 2 is demagnetized, cooling Stage 1 to 0.75 K
6. HS1 is powered off
7. Stage 1 is demagnetized to 0.05 K, and Stage 2 to 0.5 K

---

**ADR Mass Gauging**

- Each ADR recycle rejects ~11.2 J to the helium tank
- The temperature rise and heat input can be used to determine the helium volume
- The mass loss rate was 0.024 liters/day (±10%)
- The predicted lifetime for 36 liters was 4.2 years

---

**Detector Cooling On Orbit**

- Hitomi launched with ~36 liters of liquid helium
- ADR operations began on Day 5
- ADR was operated only in Cryogen Mode
- ADR was recycled 18 times before operations ended on Day 38
- Heat load continually decreased as He tank cooled, eventually yielding a hold time of 48 hours

---

**Orbit Operation Summary**

- SXS instrument operated flawlessly through 38 days on orbit
- ADR was cycled 18 times
  - Recycle operation requires <0.8 hours
  - Hold time ~48 hours, with stability of ~1 µK rms at 50 mK
- Duty cycle in excess of 98%
- Total heat load to 50 mK was ~0.8 µW
  - Inferred detector heat load was ~0.4 µW
- Time average heat output to the helium tank was <0.07 mW

---
