NASA Electric Propulsion System Studies

James L. Felder, Systems Analysis & Integration
Advanced Air Transport Technology Project
NASA Glenn Research Center
Cleveland, OH
Outline

• Why Electric Propulsion
• Overview of Electric Propulsion architectures.
• Example Implementations.
  – Boeing SUGAR Volt
  – ECO-150
  – STARC-ABL
  – N3-X
Why Electric Propulsion

• Allows the use of non-CO2 emitting terrestrial power sources in aviation

• High flexibility in moving power around the vehicle is a key enabler for several different ways to integrate propulsion into the aircraft in ways to further reduce the energy intensity of the vehicle
  – Boundary Layer Ingestion
  – Wingtip Propulsors
  – Highly distributed embedded propulsor arrays
But Wait, There's More!

Series/Parallel Partial Hybrid

- Turbofan
- Fan
- Fuel
- Electric Bus
- Generator
- Battery
- Motor
- 1 to Many Fans
Boeing SUGAR Volt (Parallel Hybrid)

- 150 passenger
- 3500 nm range
- 750 Wh/kg battery energy density
- 1.3 MW motor meets NASA N+3 fuel reduction goal at the same energy consumption as SUGAR High
- 5.3 MW motor reduces fuel consumption further at the price of increased energy consumption compared to SUGAR High

Boeing Research & Technology, Boeing N+3 Subsonic Ultra Green Aircraft Research (SUGAR) Final Report
SUGAR Volt Hybrid Electric technologies provide additional benefits only if a renewable energy source is used to charge aircraft batteries.
Flow around an aircraft tailcone

- Diffusion into the base region of the aircraft means the velocity profiles represent more than just the viscous boundary layer of the fuselage
- Velocity profile nearly uniform circumferentially, so distortion is nearly all radial

*STARC-ABL: Single-aisle Turboelectric AirCRAFT – Aft Boundary Layer*
ESAero ECO-150
(Fully Turboelectric/Distributed)

- 150 Passenger/35k lbs Payload
- 3500 nm range
- Mach 0.8 Cruise
- 2 8-MW turbine driven generators
- 16 1-MW motor driven fans
- Fuel reduction from 737-700
  - 44% Non-cryo
  - 59% Cryo (with LH2 cooling)

NASA N3-X
(Fully Turboelectric/Distributed/BLI )

Baseline: B777-200LR/GE90-115B
Passengers: 300
Range: 7500 nm
Payload: 118,000 lbs
Cruise Speed: Mach 0.84
Fuel: 279,800 lbs

N3-X Superconducting
Passengers: 300
Range: 7500 nm
Payload: 118,000 lbs
Cruise Speed: Mach 0.84
Fuel: 76,000 lbs
(-72%)
Generators: 30 MW
Motors: 4.3 MW

## NASA N3-X Propulsion System Weight

For the power range bar for each aircraft class

- The left side is the smallest electrical machine in a partially electrified system
- The right side is the size of the generator in a twin engine fully electrified system
