NASA OSMA NDE Program
Additive Manufacturing Foundational Effort

Jess Waller (NASA WSTF), James Walker (NASA MSFC), Eric Burke, (NASA LaRC), Douglas Wells (NASA MSFC), Charles Nichols (NASA WSTF)

NASA QUALITY ASSURANCE IN ADDITIVE MANUFACTURING (AM)
A WORKSHOP ON ASSURING AM PRODUCT INTEGRITY
October 11-12, 2016
Beckman Auditorium, California Institute of Technology, Pasadena CA

Approved for public release
Background

• NASA is providing key leadership in an international effort linking NASA and non-NASA resources to speed adoption of additive manufacturing (AM) to meet NASA’s mission goals. Participants include industry, NASA’s space partners, other government agencies, standards organizations and academia:

• Nondestructive Evaluation (NDE) is identified as a universal need for all aspects of additive manufacturing
Background

Contacts: Jess Waller (WSTF); James Walker (MSFC); Eric Burke (LaRC)

- NASA Agency additive manufacturing efforts were catalogued
- Industry, government and academia were asked to share their NDE experience in additive manufacturing
- NIST and USAF additive manufacturing roadmap were surveyed and a technology gap analysis performed
- NDE state-of-the-discipline was documented
NASA Agency & Prime Contractor Activity

- Inconel Pogo-Z baffle for RS-25 engine for SLS
- Prototype titanium to niobium gradient rocket nozzle
- ISRU regolith structures
- Reentrant Ti6-4 tube for a cryogenic thermal switch for the ASTRO-H Adiabatic Demagnetization Refrigerator
- Made in Space AMF on ISS
- Dynetics/Aerojet Rocketdyne F-1B gas generator injector
- SpaceX SuperDraco combustion chamber for Dragon V2
- EBF³ wire-fed system during parabolic flight testing
- 28-element Inconel 625 fuel injector

Aerojet Rocketdyne RL-10 engine thrust chamber assembly and injector

Dynetics/Aerojet Rocketdyne F-1B gas generator injector

SpaceX SuperDraco combustion chamber for Dragon V2
NDE of AM Technology Gaps

- Develop in-process NDE to improve feedback control, maximize part quality and consistency, and obtain ready-for-use certified parts
- Develop post-process NDE of finished parts
- Develop voluntary consensus standards for NDE of AM parts
- Develop better physics-based process models using and corroborated by NDE
- Use NDE to understand scatter in design allowables database generation activities (process-structure-property correlation)
- Fabricate AM physical reference samples to demonstrate NDE capability for specific defect types
- Apply NDE to understand effect-of-defect, and establish acceptance limits for specific defect types and defect sizes
- Develop NDE-based qualification and certification protocols for flight hardware (screen out critical defects)
Develop and Capture
Best NDE Practice
NDE of AM Technology Gaps

• Develop **in-process NDE** to improve feedback control, maximize part quality and consistency, and obtain ready-for-use certified parts
• Develop **post-process NDE** of finished parts
• Develop **voluntary consensus standards** for NDE of AM parts
• Develop better **physics-based process models** using and corroborated by NDE
• Use NDE to understand scatter in **design allowables database** generation activities (process-structure-property correlation)
• Fabricate AM **physical reference samples** to demonstrate NDE capability for specific defect types
• Apply NDE to **understand effect-of-defect**, and establish acceptance limits for specific defect types and defect sizes
• Develop **NDE-based qualification and certification protocols** for flight hardware (screen out critical defects)
United States and International AM Standardization Efforts

ASTM WK47031, NDE of metal parts used in aerospace applications (NASA leadership)

ASTM E07.10 WK47031 NDE of AM Guide

ISO TC 261 JG59 Best NDE Practice

- First defect catalogues to show defect ↔ NDE linkage
- Process method determines defects
- Defect type & part complexity determine NDE selection
49 current members

NASA, JAXA, ESA, NIST, USAF, GE Aviation, Boeing, Lockheed, Aerojet Rocketdyne, Honeywell, ULA and various AM and NDE community participants are represented
Coordinated by S. James (Aerojet Rocketdyne)

**Electron Beam Freeform Fabrication (EBF³)**
- Inconel 625 on copper
- Ti-6Al-4V (4)
- SS 316
- Al 2216

**Selective Laser Melting (SLM)**
- Ti-6Al-4V bars
- Al-Si-10Mg dog bones
- Inconel 718 inserts (6) w/ different processing history
- Inconel 718 prisms for CT capability demonstration

**Electron Beam Melting (EBM)**
- SS 316 PT/RT panels w/ EDM notches

Characterized to date by various NDE techniques (CT, RT, PT, PCRT, and UT)
Identify Relevant Defects
Background
While certain AM flaws (e.g., voids and porosity) can be characterized using existing standards for welded or cast parts, other AM flaws (layer, cross layer, unconsolidated and trapped powder) are unique to AM and new NDE methods are needed.

Note: DED = Directed Energy Deposition, PBF = Powder Bed Fusion
Typical PBF Defects of Interest

Also have unconsolidated powder, lack of geometrical accuracy/steps in the part, reduced mechanical properties, inclusions, gas porosity, voids, and poor or rough surface finish
Typical PBF and DED Defects

Also interested in (gas) porosity and voids due to structural implications

Note: proposed new definitions in ISO/ASTM 52900 Terminology:

- Lack of Fusion (LOF), n — flaws caused by incomplete melting and cohesion between the deposited metal and previously deposited metal.

- Gas Porosity, n — flaws formed during processing or subsequent post-processing that remain in the metal after it has cooled. Gas porosity occurs because most metals have dissolved gas in the melt which comes out of solution upon cooling to form empty pockets in the solidified material. Gas porosity on the surface can interfere with or preclude certain NDT methods, while porosity inside the part reduces strength in its vicinity. Like voids, gas porosity causes a part to be less than fully dense.

- Voids, n — flaws created during the build process that are empty or filled with partially or wholly un-sintered or un-fused powder or wire creating pockets. Voids are distinct from gas porosity, and are the result of lack of fusion and skipped layers parallel or perpendicular to the build direction. Voids occurring at a sufficient quantity, size and distribution inside a part can reduce its strength in their vicinity. Voids are also distinct from intentionally added open cells that reduce weight. Like gas porosity, voids cause a part to be less than fully dense.
Demonstrate NDE Capability
NDE of AM Technology Gaps

- Develop **in-process NDE** to improve feedback control, maximize part quality and consistency, and obtain ready-for-use certified parts
- Develop **post-process NDE** of finished parts
- Develop **voluntary consensus standards** for NDE of AM parts
- Develop better **physics-based process models** using and corroborated by NDE
- Use NDE to understand scatter in **design allowables database** generation activities (process-structure-property correlation)
- Fabracte AM **physical reference samples** to demonstrate NDE capability for specific defect types
- Apply NDE to understand effect-of-defect, and establish acceptance limits for specific defect types and defect sizes
- Develop **NDE-based qualification and certification protocols** for flight hardware (screen out critical defects)
Demonstrate NDE capability

Investigate effect post-processing on microstructure and surface finish on fatigue properties

---

**Materials**

- **AlSi10Mg** ASTM E8 compliant dogbones
  - 13mmØ, 85mm long (6mmØ, 30mm Gauge Length)

---

**Projects**

- **FY17 STTR T12.04-9941 Real-Time Geometric Analysis of Additive Manufacturing status (NASA MSFC)** Develops a novel process control and part documentation solution for selective laser melting (SLM) additive manufacturing (DECLINED).

- **FY17 STTR T12.04-9979 Metal Digital Direct Manufacturing (MDDM) for Close-Out of Combustion Chambers and Nozzle Fabrications.** Sub-scale and intermediate size nozzles will be fabricated using hybrid MDDM processes and delivered to the NASA-MSFC for hot fire testing (APPROVED).

---

**Materials**

- **Ti-6Al-4V** ASTM E8 compliant dogbones for *in situ* OM/IR and post-process profilometry, CT and PCRT.
Qualify & Certify NASA AM Hardware
NDE of AM Technology Gaps

- Develop **in-process NDE** to improve feedback control, maximize part quality and consistency, and obtain ready-for-use certified parts
- Develop **post-process NDE** of finished parts
- Develop **voluntary consensus standards** for NDE of AM parts
- Develop better **physics-based process models** using and corroborated by NDE
- Use NDE to understand scatter in **design allowables database** generation activities (process-structure-property correlation)
- Fabricate AM **physical reference samples** to demonstrate NDE capability for specific defect types
- Apply NDE to **understand effect-of-defect**, and establish acceptance limits for specific defect types and defect sizes
- Develop **NDE-based qualification and certification protocols** for flight hardware (screen out critical defects)
Background

Contact: Doug Wells (MSFC)

- Comprehensive draft technical standard is in review
- All Class A and B parts are expected to receive comprehensive NDE for surface and volumetric defects within the limitations of technique and part geometry
- Not clear that defect sizes from NASA-STD-5009§ are applicable to AM hardware
- NDE procedural details are still emerging

§NASA-STD-5009, Nondestructive Evaluation Requirements for Fracture-Critical Metallic Components
Background

Comprehensive NDE required for surface and volumetric defects

---

§ NASA classifications should not to be confused with those used in the ASTM International standards for AM parts, such as F3055 Standard Specification for Additive Manufacturing Nickel Alloy (UNS N07718) with Powder Bed Fusion. The ASTM classes are used to represent part processing only and are unrelated.
Qualification & Certification

- It is incumbent upon the structural assessment community to define critical initial flaw sizes (CIFS) for the AM part to define the objectives of the NDE.
- Knowledge of the CIFS for AM parts will allow the NDE and fracture control communities to evaluate risks and make recommendations regarding the acceptability of risk.
- CIFS defects shall be detected at the accepted probability of detection (POD), e.g., 90/95, for fracture critical applications.
- Demonstration of adequate part life starting from NASA-STD-5009 flaw sizes is generally inappropriate for fracture critical, damage tolerant AM parts.
- It is recognized that parts with high AM Risk may have regions inaccessible to NDE. To understand these risks it is important to identify the inaccessible region along with the CIFS.
Qualification & Certification

- Parts with low AM risk should exhibit much greater coverage for reliable NDE.
- Multiple NDE techniques may be required to achieve full coverage.
- Surface inspection techniques (PT, ECT, UT) may require the as-built surface be improved to render a successful inspection, depending upon the defect sizes of interest and the S/N ratio.
- For PT, surfaces improved using machining, for example, require etching prior to inspection to remove smeared metal.
  - Removal of the as-built AM surface to a level of visually smooth may be insufficient to reduce the NDE noise floor due to near-surface porosity and boundary artifacts.
- NDE demonstration parts with simulated CIFS defects are used to demonstrate NDE detection capability.
- NDE standard defect classes for welds and castings welding or casting defect quality standards will generally not be applicable.
Qualification & Certification

- Relevant AM process defect types used must be considered.
- AM processes tend to prohibit volumetric defects with significant height in the build (Z) direction. The concern instead is for planar defects, such as aligned or chained porosity or even laminar cracks, that form along the build plane. The implications of this are:
  - planar defects are well suited for growth
  - planar defects generally have low contained volume
  - the orientation of defects of concern must known before inspection, especially when detection sensitivity depends on the defect orientation relative to the inspection direction
  - the Z-height of planar defects can be demanding on incremental step inspection methods such as CT

- Until an AM defects catalog and associated NDE detection limits for AM defects are established, NDE acceptance criteria shall be for part-specific point designs.
Determine Rejection Thresholds for Critical Defects

SAVE THE DATE

Round Table Discussion: Mechanical Behavior of Additive Manufactured Components
May 5, 2016
San Antonio, TX

About the Event
A Round Table Discussion on Mechanical Behavior of Additive Manufactured Components will be held Thursday, May 5, 2016 and is sponsored by ASTM Committee E08 on Fatigue and Fracture in conjunction with F42 on Additive Manufacturing Technologies and E07 on Nondestructive. The discussion will be held at the Grand Hyatt San Antonio in San Antonio, TX, in conjunction with the May standards development meetings of the committee.

The Round Table Discussion is a supplement to the Workshop on Mechanical Behavior of Additive Components and will provide a forum for the exchange of ideas regarding the mechanical behavior of components fabricated using additive manufacturing, with a focus on the development of fatigue related standards for additive manufacturing.

For more information please visit: http://www.astm.org/E08RTD5-2016

Working Group (WG) Architecture and Co-Chairs
(updated 5/13/16)

Below is the evolving list of WGs and their co-chairs, and issues that they will be addressing in terms of identifying existing or needed standards and specifications. Participants are invited to sign up for one or more groups using the sign-up sheet. The working groups are holding online meetings every two weeks. (Note: Specific meeting times should be confirmed with ANSI as recurring meeting times listed below are subject to change on specific dates when there are holidays or other conflicts that may necessitate re-scheduling.)

**Design WG**
Meets: Every other Tuesday, 10-11:30 am Eastern, beginning May 10, 2016
Co-chairs: John Schmelzle, NAVAIR, and Jayanthi Parthasarathy, MedCAD

Input (Design guides, Design intent)
Designing parts (Design tools, Simulation and modeling, Design for assemblies)
Design documentation (Neutral build file, Product definition data sets)
Validation

**Process and Materials WG**
* Meets: Every 4th Tuesday, 11 am – 12 noon Eastern, beginning May 24, 2016
  Co-chairs: Todd Rockstroh, GE Aviation, and Art Krakos, AAK Consulting LLC
  * All members are asked to join one of the 4 Subgroups (SG)

Future State: Left to Right Enabling Commercialized AM products

## Qualification & Certification (Q&C) WG

Meets: Every other Monday, 2:30 – 4 pm Eastern, beginning May 9, 2016

Co-chairs: Armen Kurdian, U.S. Navy, and Shawn Moylan, NIST

Ensure that all stages of a particular AM process have commonly understood standards to enable Qualification

(Qualification is defined as ensuring suitability to meet functional requirements in a repeatable manner)

Ensure that AMSC WGs have adequate representation from industry & government

Generate checklists for all aspects of AM (variability, repeatability, suitability, etc.)
America Makes & ANSI Additive Manufacturing Standardization Collaborative (AMSC)

America Makes & ANSI Additive Manufacturing Standardization Collaborative (AMSC)
Working Group (WG) Architecture and Co-Chairs
(updated 5/13/16)

Non-Destructive Evaluation (NDE) WG
Meets: First Meeting May 20, 2016 at 1 pm Eastern
Co-chairs: TBD

Scope: NDE of Finished Parts
Test methods or best practice guides for NDE of AM parts
Common defects found in AM parts and Probability of Detection (PoD) assessments of NDE techniques
Test samples for PoD or NDE technique performance evaluation
Geometry and surface texture measurement techniques (especially for internal features)
Gaps in current NDT methods
AM defects terminology
Intentionally seeding AM flaws

Maintenance WG
Meets: Every other Monday 2-3:30 pm Eastern, beginning May 16, 2016
Co-chairs: David Coyle, NAVSUP WSS, and Michele Hanna, Lockheed Martin

Scope: Maintenance of parts and machines
Standard repair procedures for parts and tooling
Standard inspection processes
Model based inspection
THIS IS ONLY THE BEGINNING

Key Documents Driving the Improved Safety and Reliability of AM Parts

NASA AM Foundational Effort

Technological Acceptance and Increased Utilization
NIST Roadmap

Contact: Kevin Jurrens (NIST)
- Technology challenges impede widespread adoption of AM
- Measurement and monitoring techniques, including NDE, cut across all aspects of AM, from input materials to processing to finished parts
- Ways to fully characterize AM parts, including NDE, are needed to insure processing effectiveness and part repeatability (part certification)
- NASA participation
  - Matt Showalter, GSFC
  - Karen Taminger, LaRC
  - Gary Wainwright, LaRC
  - Nancy Tolliver, MSFC
Effect of Design Complexity on NDE

Contact: Evgueni Todorov (EWI)
- Great initial handling of NDE of AM parts
- Report has a ranking system based on geometric complexity of AM parts to direct NDE efforts
- Early results on NDE application to AM are documented
- Approach for future work based on CT and PCRT
Effect of Design Complexity on NDE

Most NDE techniques can be used for Complexity Groups $§$ 1 (Simple Tools and Components) and 2 (Optimized Standard Parts), some for Group 3 (Embedded Features); only Process Compensated Resonance Testing and Computed Tomography can be used for Groups 4 (Design-to-Constraint Parts) and 5 (Free-Form Lattice Structures):
