18650 Cell Bottom Vent: Preliminary Evaluation into its Merits for Preventing Side Wall Rupture

By

Natalie Anderson, Minh Tran, and Eric Darcy
NASA-JSC

S&T Meeting
San Diego, CA
7 Dec 2016
Outline

• 5 Design Guidelines
• Trading thermal isolation vs heat dissipation
  – Full thermal isolation
  – Drawing heat from cell bottoms
  – Full can length interstitial heat sink approach
• Risk of side wall rupture during thermal runaway
• New cell designs with cell bottom vent from Sony and LG
  – Vent & burst pressure
  – Thermal runaway performance
• Summary of findings to date
• Future work
High Power/Energy 18650 Cell Designs

- Specific Energy Range 259-276 Wh/kg
- Energy Density Range 704-735 Wh/L

After 350mA charge to 4.2V to 70mA taper
Room temperature
Specific Energy (Wh/kg) Trends

Source: Sanyo/Panasonic 2010

A high production rate design that achieves > 240 Wh/kg and > 660 Wh/L exists since 2012

Specify energy improvements are trending at 7-10% per year….should get to 300 Wh/kg by 2017
Cell Can Wall Cross Sections

NCR18650B COTS design averages 127 \( \mu \)m
ICR18650-26F (2.6Ah Samsung) averages 160 \( \mu \)m
ICR18650J (2.4Ah Moli) averages 208 \( \mu \)m

Thin can wall with \( >660 \text{ Wh/L} \) \( \Rightarrow \) high propensity to side wall ruptures/breaching

Other factors include high reaction kinetics and high header crimp burst pressure
Axial View – Header of NCR18650B Cell

5 Design Driving Factors for Reducing Hazard Severity from a Single Cell TR

• Reduce risk of cell can side wall ruptures
  – Without structural support most high energy density (>660 Wh/L) designs are very likely to experience side wall ruptures during TR
  – Battery should minimize constrictions on cell TR pressure relief

• Provide adequate cell spacing and heat rejection
  – Direct contact between cells nearly assures propagation
  – Spacing required is inversely proportional to effectiveness of heat dissipation path

• Individually fuse parallel cells
  – TR cell becomes an external short to adjacent parallel cells and heats them up

• Protect the adjacent cells from the hot TR cell ejecta (solids, liquids, and gases)
  – TR ejecta is electrically conductive and can cause circulating currents

• Prevent flames and sparks from exiting the battery enclosure
  – Provide tortuous path for the TR ejecta before hitting battery vent ports equipped flame arresting screens
Current Spacesuit Battery Design

Solid Al side panels block cell vents

Design Features
- 80 Li-ion cells (16p-5s)
- ICR-18650J from E-one Moli Energy (2.4Ah)

Compliance with the 5 rules
- Minimize side wall ruptures ✓
- No direct cell-cell contact ✓
- Individually fusing cell in parallel ✗
- Protecting adjacent cells from TR ejecta ✗
- Include flame arresting vent ports ✗
Battery external surfaces reach 350°C
Vented some sparks and much smoke for > 15 min
Jeevarajan et al. from 2014 Workshop showed that without any heat dissipation path except through electrical parallel connections, adjacent cells get damaged (shorted) with even 4 mm spacing.
VHS TR Test with Panasonic NCR18650B Cells

- Vaporizing Heat Sink (VHS) leaves 10mm of cell can wall bottoms exposed
- 2mm spacing between cells
- Trigger cell had side wall rupture in circumferential heater area which impinged TR ejecta into adjacent cell
- Resulted in propagation to two additional cells and damaged several others

Side wall ruptures will even defeat very high flux heat rejection paths!
Orion Battery 14-cell Block

Upper Capture Plate
- G10 FR4 Fiberglass Comp

MACOR Vent Tubes

Syntactic Foam Liner

18650 Cell

304 Stainless Steel Sleeve – 9 mil wall thickness

Lower Heat-Sink Capture Plate
- 6061-T651 Alum

Orion 14P-8S
Superbrick

Draw cell heat generation through cell bottom
Isolating vs Providing a heat path

• If you thermally isolate cells (air)
  – Adjacent cell $\Delta T$ rise 80-100°C
  – *Limited to cell designs with little risk of side wall ruptures*
  – Achieves 160-170 Wh/kg

• Orion - Partially conductive (Draw heat from cell bottom)
  – Conduct heat to divider plate
  – Adjacent cell $\Delta T$ rise 60-70°C and shorter exposure
  – 14P-8S superbrick with SS sleeves achieves 150-160 Wh/kg
Safer, Higher Performing Battery Design

Features
- 65 High Specific Energy Cell Design 3.4Ah (13P-5S)
- 37Ah and 686 Wh at BOL (in 16-20.5V window)
- Cell design likely to side wall rupture, but supported

Compliance with the 5 rules
- Minimize side wall ruptures
  - Al interstitial heat sink
- No direct cell-cell contact
  - 0.5mm cell spacing, mica paper sleeves on each cell
- Individually fusing cell in parallel
  - 12A fusible link
- Protecting adjacent cells from TR ejecta
  - Ceramic bushing lining cell vent opening in G10 capture plate
- Include flame arresting vent ports
  - Tortious path with flame arresting screens
  - Battery vent ports lined with steel screens

65-Battery Brick
LLB2 Heat Sinks

No corner cells - Every cell has at least 3 adjacent cells

0.5mm cell spacing, Al 6061T6
• 13P-5S Configuration with 3.4 Ah LG cell design yielding 37 Ah at 3.8 A mission rate.
• Aluminum interstitial heat sink, 0.5 mm spacing between cells
• Mica sleeves around shrink wrap, 2 FT
• The G10 capture plate houses the + and - ends of the cells and prevents the Ni bussing from shorting to the heat sinks.
• The ceramic Macor bushing acts as a chimney to direct ejecta outwards and protect the G10/FR4 capture plate.
Cell Brick Assembly > 180 Wh/kg

- With 12.41 Wh/cell, cell brick assembly achieves **191 Wh/kg**
  - Assuming 12.41Wh per cell
- Design has 1.4 parasitic mass factor
  - Cell mass x 1.4 = Brick mass

**Mass Distribution**

![Mass Distribution Diagram](image)
Attempts to Drive TR with Cell Bottom Heater Fails

Heater fails at 48W

Can’t get trigger cell > 100°C after > 1hr and 3 attempts
Metallic Interstitial Heat Sink is Effective

- Cell can be isolated with mica paper sleeves and a very small air gap.
- Heat sink spreads heat more quickly through multiple layers than through mica and onto cells.
- Heat from the trigger cell is quickly dispersed and shared among more cells.

Graphic and analysis courtesy of Paul Coman.

2.4Ah 18650 with ISC device
2.4Ah Cell with ISC Device – JR Ejection
Full Scale Battery TR Test – MoliJ ISC Cell

Heater power ~42W for 180s. Onset of TR (OTR) occurs 180s after power on and coincides with trigger bank OCV dip.

Adjacent cell1 has $\Delta T = 58.9^\circ C$ to max of 92.0$^\circ C$, while adjacent cells 2 & 3 have $\Delta T = 48^\circ C$ to max of 76.0$^\circ C$

No TR propagation, max adjacent $T = 92^\circ C$

However, trigger cell was only 2.4Ah cell
No TR Propagation, Only Smoke Exits Battery

Mesh 40 & 30 steel screens arrest flames and sparks

However, trigger cell was only 2.4Ah cell
Adjacent cell temperatures TC1, TC2, and TC3 peak at 133°C, 117°C, and 117°C in 77-87s from onset temperatures of 39°C, 37°C, and 38°C for \(\Delta T = 94°C, 77°C, \) and 78°C, respectively.
No TR Propagation – Only Clean Smoke Exits Gore Vent

3.4Ah Cell with ISC device trigger location

Flame arresting steel screens

3.4Ah cell with ISC device in 3rd JR wind

Battery bottom edge seal fails and relieves internal pressure at ~11.4 psig (0.77 bar)

Gore fabric Vent design
3.4 Ah Trigger Cell Experienced a Side Wall Rupture

Trigger cell was a struggle to extract from heat sink. The mica insulation was severely damaged adjacent to rupture.

2nd Test with 3.4Ah ISC Trigger

Flames exiting from top and sides of box, less than 1 second

Pre-photos show box is sealed...

Cell flame path was insufficiently tortious and sparks burn through 2 Gore vents

Not enough sealant on screw and hole
2nd Test 3.4Ah ISC Trigger Cell – OCV, Heaters, & Interior Temps

Adjacent cell max temperatures < 83°C
Post-Test Photos – Trigger Cell

Post-Test Mass: 25.3g

Bottom breach

Spin groove is stretched
Findings from 2nd Test with 3.4Ah ISC Trigger Cell

• ISC device in 3.4Ah 18650 cell triggered in 127 seconds with bottom heater at 32W average
  – Very similar initiation time (1st run was in 119s)
  – Very similar biasing of adjacent cells (34-35°C) at onset of TR (1st run at 37-39°C)

• No propagation of TR
  – Despite bottom rupture of trigger cell, which damaged the G10/FR4 negative capture plate
  – Reusing the same heat sinks from the first test – undamaged after both tests

• Max adjacent cell temperatures < 83°C
  – Adjacent cell temperature rise was 46-47°C, significantly lower than 1st run (77-94°C)
  – Bottom rupture yields a much less severe impact than side wall rupture
Spacesuit Prototype Battery Test Summary

- **Al Heat Sink Tests**
  - 4 attempts to drive > 250Wh/kg cell into TR – All failures
    - 2 with Panasonics, 2 with LGs, all with home made bottom heaters
  - 5 attempts with 2.4Ah ISC device cells – No propagation of TR
    - 1 dud and 4 success with the 2.4Ah ISC cell driven into TR
  - 2 heat to vent tests with 5 fully charged 3.4Ah cells each
    - No side wall ruptures in areas supported by the sink

- **LLB2 brick tests (All six 2.4Ah ISC cells successfully driven to TR)**
  - 3 no-Ni bussing brick tests
    - No TR propagation and no OCV changes to adjacent cells with excellent temp margins
      - Interior cell trigger $\Delta T \sim 19^\circ C$ (one run)
      - Edge cell trigger $\Delta T \sim 42^\circ C$ (two runs)
    - Interior cell trigger are less vulnerable than edge cells based on temperature rise (max-onset T) on adjacent cells
  - 3 Ni bussing (13P5S)
    - No propagation of TR, no impact on adjacent cell OCVs
    - Very good temperature margins (vs onset of TR temperature)
      - Interior cell trigger: $\Delta T \sim 30^\circ C$ (one run)
      - Edge cell trigger $\Delta T \sim 48^\circ C$ (one valid run)

- **LLB2 full scale tests (4 runs – 2 w/ 2.4Ah, 2 with 3.4Ah ISC device implanted cells)**
  - No propagation of TR (even with side wall rupture of trigger cell in 1st test w/ 3.4Ah trigger cell)
  - Maximum adjacent cell temperature rise with 2.4Ah trigger cell was 55-58°C
  - Maximum adjacent cell temperature rise with 3.4Ah trigger cell was 94°C w/ side wall rupture and 46°C with bottom rupture
  - Gore vent design needs more flame arresting protection to handle 3.4Ah cell TR output
  - Screened vents were demonstrated as a successful flame arresting solution
ISC Device Location Reveals Side Wall Rupture Risk

- 3.4Ah cell can thickness
  - 165 microns
  - No bottom vent
- Unsupported oven heating test
  - No side wall ruptures (30 cells)
  - Slow external heating to TR
- Unsupported circumferential heater test
  - No side wall ruptures (5 cells) at ~30W
  - 1 of 3 side wall rupture at ~60W
- With ISC device (11 tested so far)
  - 8 sidewall ruptures
    - 5 unsupported
    - 3 supported by Al interstitial heat sink
  - 1 bottom rupture
    - Supported by Al interstitial heat sink
  - 2 vented through header
    - Supported by Fe tubes

Photo credit: D. Finegan, University College of London
How Effective Are Steel Tubes?

- Fully charged 3.4Ah ISC device cells in positions 1 (corner) and 8 (interior) clocked towards adjacent cells.
- Block heated to > 60°C to activate ISC devices.
- Corner cell wrapped with 0.015” (381 μm) SS tube experienced side wall rupture outside of tube.
  - Dissection of tube found no cell can side wall ruptures inside tube area.
- Interior cell wrapped with 0.009” (229 μm).
  - No side wall ruptures outside or inside tube.

Typical TR Performance of Bottom Vents

Sony VC7

LG M36-BV

Patch heater applied to bottom half of cell can
Post TR Test Photos

Sony VC7

LG M36-BV

Ten cells driven into TR for each design
Two views showing 4 of the 10 cells that vented through the bottom and experienced side wall ruptures in area exposed to heater.
Bottom vent works but 3 of 10 cells experienced side wall ruptures in area exposed to heater

Big Caveat:
- This test weakens the cell can. NCR18650B cell design without bottom vent experiences much higher rate of side wall rupture.
Summary Findings

- ISC device enables critical battery safety verification
  - With the aluminum interstitial heat sink between the cells, normal trigger cells can’t be driven into TR without excessive temperature bias of adjacent cells
  - With an implantable, on-demand ISC device, TR tests show that the conductive heat sinks very effectively protected adjacent cells from propagation
    - Even with >700 Wh/L cell design experiencing side wall or bottom rupture (4 test runs)
  - 3.4Ah 18650 cell design shown susceptible to side and bottom rupture with ISC device
    - Note that no side wall ruptures occurred during slow heat to TR testing (unsupported, 30 cells tested)
- High heat dissipation and structural support of Al heat sinks show high promise for safer, higher performing batteries
  - Battery brick design achieving > 190Wh/kg demonstrated to be safe
- Preliminary results on bottom vents are inconclusive
  - TR testing with ISC device is needed

Future work
- Will examine impact of the location of the ISC device in the JR
- Will examine merits of cell designs with bottom burst disk vent feature to reduce side wall rupture risk
  - Is it a better solution than thicker can and/or lower header burst pressure?
