Clear Paths
The Earthdata Developer Portal provides clear paths to get you started with core EOSDIS applications. Each path is accompanied by an overview page that explains the goal of the path and a short overview of each element along with links for detailed documentation of each component.

Decentralized Content, Centralized
A key benefit of the Earthdata Developer Portal is that its contents is provided by and owned by original application owners and teams. This means that these teams do not have to reproduce any content. There are no documents that have to be kept in sync. EDP pulls from the source. As development teams update APIs, community leaders tweak best practice recommendations, and design teams add design components to front-end frameworks, the EDP simply serves as a viewer for that content. This means you can come to one place to find what you need and consume that content in a familiar and consistent user interface.
