Ceramic Expo
April 26-28, 2016
Cleveland, Ohio 44135
Durable Environmental Barrier Coating Systems for Ceramic Matrix Composites (CMCs):
Enabling Technology for Next Generation Low Emission, High Efficiency and Light-Weight Propulsion

— NASA Environmental barrier coatings (EBCs) development objectives
  • Help achieve future engine temperature and performance goals
  • Ensure system durability – towards prime reliant coatings
  • Establish database, design tools and coating lifing methodologies
  • Improve technology readiness

Fixed Wing Subsonic Aircraft  Supersonics Aircraft  Hybrid Electric Propulsion Aircraft
NASA Environmental Barrier Coating Development Goals

Emphasize temperature capability, performance and durability

- 2700-3000°F (1482-1650°C) turbine and CMC combustor coatings
- 2700°F (1482°C) EBC bond coat technology for supporting next generation engines
- Develop innovative coating technologies and life prediction approaches
  - Meet 1000 h for subsonic aircraft and 9,000 h for supersonics/high speed aircraft hot-time life requirements

* Recession: <5 mg/cm² per 1000 hr (40-50 atm., Mach 1~2)
** Component strength and toughness requirements

Temperature Capability

- 2800°F combustor TBC
- 2500°F Turbine TBC

Increase in $\Delta T$ across T/EBC

Ceramic Matrix Composite

Single Crystal Superalloy

Gen I – Current commercial

Gen III

Gen IV

Year

- Gen II

Step increase in the material's temperature capability

- 300°F SiC/SiC CMC airfoil and combustor technologies
- 2700°F SiC/SiC thin turbine EBC systems for CMC airfoils
- 2400°F (1316°C) Gen I and Gen II SiC/SiC CMCs
- 2000°F (1093°C)
- 3000°F (1650°C+)

2700°F (1482°C) Gen III SiC/SiC CMCs

2500°F (1316°C) Gen I and Gen II SiC/SiC CMCs

2800ºF combustor TBC

2500ºF Turbine TBC
Outline

— Advanced EBC systems development for CMC airfoils and combustors
  • Prime-reliant EBCs for CMCs: a turbine engine design requirement
  • Fundamental recession of SiC/SiC
  • Thermomechanical, environment and thermochemical stability design considerations
  • Advanced EBC processing, testing and durability
  • NASA 2700-3000°F (1482-1650°C) EBC material systems
  • Current turbine and combustor EBC coating emphases – coating configurations

— Environmental barrier coating system development
  • NASA 2700°F EBC technologies

— Design tool and life prediction perspectives of EBC coated CMC components

— Summary and future directions
Fundamental Recession Issues of CMCs and EBCs

- **Recession of Si-based Ceramics**
  (a) Convective; (b) Convective with film-cooling
  - High temperature Capable and Low SiO₂ activity EBC system development

- **Advanced rig testing and modeling**
  More complex recession behavior of CMC and EBCs in test rigs simulated combustion flow and pressure conditions

Recession rate = const. \( V^{1/2} \frac{P_{(H₂O)}^2}{(P_{total})^{1/2}} \)

\[
\text{SiO}_2 + 2\text{H}_2\text{O}(g) = \text{Si(OH)}_4(g)
\]

(a) Combustion gas

(b) Cooling gas
Environmental Stability of Selected Environmental Barrier Coatings Demonstrated in NASA High Pressure Burner Rig

- EBC stability evaluated on SiC/SiC CMCs in high velocity, high pressure burner rig environments
- Focused on 2700-3000°F EBCs
- More stable turbine coatings developed under NASA programs for advanced engine applications

Stability and temperature capability improvements through coating composition and architecture innovations

High Pressure Burner Rig
Advanced EBC Developments

- Fundamental studies of environmental barrier coating materials and coating systems, stability, temperature limits and failure mechanisms
- Focus on high performance, high stability HfO\textsubscript{2} - and ZrO\textsubscript{2}-RE\textsubscript{2}O\textsubscript{3}-SiO\textsubscript{2}/RE\textsubscript{2}Si\textsubscript{2-x}O\textsubscript{7-2x} environmental barrier systems
  - More advanced, multicomponent composition and composite EBC systems to improve the temperature capability, strength and toughness
  - Develop HfO\textsubscript{2}-Si based + X (dopants) bond coat systems for 2700°F (1482°C) long-term applications
  - Develop prime-reliant 2700°F+ (1482°C) Rare Earth (RE)-Si + X (dopants) bond coat systems for advanced integrated EBC-CMC systems, improving bond coat temperature capability and durability
- Processing optimizations for improved composition control and process robustness
Advanced EBC Developments – Development Timelines

— Major development milestones:

• 1995-2000: BSAS/Mullite+BSAS/Si
• 2000-2004: RE$_2$Si$_2$O$_7$ or RE$_2$SiO$_5$/BSAS+Mullite/Si
• 2000-2004 - 3000°F EBC systems:
  Low conductivity (HfO$_2$-RE$_2$O$_3$-X Dopants) EBCs / RE$_2$Si$_2$O$_7$ or RE$_2$SiO$_5$ and/or BSAS+Mullite/Si and Oxide + Si bond coats;
    – HfO$_2$-Si based bond coats developed to overcome low melting point Si bond coat issues
    – Along with ceramic component demonstrations in rigs
• 2005-2011 - Turbine coating systems:
  Multi-component, HfO$_2$-Rare Earth Oxide-SiO$_2$/ multi-component Rare Earth Silicate/ HfO$_2$-Si systems
    – RE-HfO$_2$-X/Multicomponent RE-silicate / HfO$_2$-Si +X (doped)
• 2009 - present: Improved EBC compositions and processing; advanced 2700F RE-Si bond coats
  – e.g., (Gd,Yb,Y)Si bond coats and top coats

Plasma Sprayed-Physical Vapor Deposition (PS-PVD) Processing of Environmental Barrier Coatings

— NASA PS-PVD and PS-TF coating processing using Sulzer (Oerlikon) newly developed technology

• High flexibility coating processing – PVD - splat coating processing at lo pressure (at ~1 torr)
• High velocity vapor, non line-of-sight coating processing potentially suitable for complex-shape components
• Significant progress made in processing the advanced EBC and bond coats

100 kW power, 1 torr operation pressure

NASA PS-PVD Coater System

Processed coating systems

HfO$_2$-Si bond coat
Advanced systems developed and to improve Technology Readiness Levels (TRL)
Composition ranges studied mostly from 50 – 80 atomic% silicon
- PVD-CVD processing, for composition downselects - also helping potentially develop a low cost CVD or laser CVD approach
- Compositions initially downselected for selected EB-PVD and APS coating composition processing
- Viable EB-PVD and APS systems downselected and tested; development new PVD-CVD approaches

Process and composition transitions

- HI02-Si; REHfSi
- YSi+RESilicate
- Hf-RESilicate
- Used in ERA components as part of bond coat system
- HI02-Si
- YSi+Hf-RESilicate
- Hf-RE-Al-Silicate
- Used also in ERA components as part of bond coat system
- REHfSi
- HfSi(O)
- APS*: or plasma spray related processing methods
Furnace Cycle and Oxidation Test Results of Selected RESi and ZrSi Based Bond Coats

- Testing in Air at 1500°C, 1 hr cycles

- Multi-component RESiO+X series 2700°F+ EBC bond coat compositions and processing developed

- The 2700°F+ EBC bond coat systems showed promise for furnace cyclic durability and oxidation resistance at 1500°C tests

- Completed initial composition down-selects

Furnace cyclic testing in Air at 1500°C, 1 hr cycles

Oxidation kinetics studied using TGA in flowing O₂
Laser Rig Thermomechanical Creep - Fatigue Tests of Advanced 2700°F+ RESi Bond Coats and EBC Systems

- APS, PVD and EB-PVD processed 2700°F bond coats and EBCs on SiC/SiC CMC: focus on creep, fatigue high heat flux testing at temperatures of 1316-1482°C+ (2400-2700°F+) – Selected Examples

EB-PVD Rare Earth Silicate EBC/YbGdYSi bond coat on Hyper Therm CVI-MI

Swirl jet flows
Thermal Gradient Fatigue-Creep Testing of Advanced Turbine Environmental Barrier Coating SiC/SiC CMCs

- Advanced environmental barrier coatings – Prepreg CMC systems demonstrated long-term EBC-CMC system creep rupture capability at stress level up to 20 ksi at $T_{EBC} = 2700^\circ F$, $T_{CMC}$ interface $\sim 2500^\circ F$
- The HfO$_2$-Si based bond coat showed excellent durability in the long term creep tests
Summary and Future Directions

• Durable EBCs are critical to emerging SiC/SiC CMC component technologies

  — The EBC development built on a solid foundation from past experience, evolved with the current state of the art compositions of higher temperature capabilities and stabilities
    — Multicomponent EBC oxide/silicates with higher stabilities
    — Improved strength and toughness
    — HfO$_2$-Si and RE-Si bond coats for realizing prime-reliant 2700°F EBC-designs

  — EBC processing and testing capabilities significantly improved, more advanced compositions designed and realized for complex turbine components

  — Develop rig EBC-CMC subelement simulated tests, helping develop coating property databases and validated life models, aiming at more robust EBC-CMC designs

  — Emphasized turbine airfoil EBC developments, demonstrated component EBC technologies in simulated engine environments of TRL 5, further maturing advanced coating technologies
