Abstract

The 4STAR (Spectrometer for Sky-Scanning, Sun-Tracking Atmospheric Research) instrument combines airborne sun tracking and remote sensing capabilities of the Ames Airborne Tracking Sun Photometer (AATS-14) with AERONET-like sky-scanning capability and adds state-of-the-art fiber-coupled grating spectrometers to yield hyperspectral measurements of direct solar irradiance and angularly resolved sky radiance. The combination of sun-tracking and sky-scanning capability enables retrievals of wavelength-dependent aerosol optical depth (AOD), mode-resolved aerosol size distribution (SD), asphericity, and complex refractive index, and thus also the scattering phase function, asymmetry parameter, single-scattering albedo (SSA), and absorption aerosol optical thickness (AAOD).

From 2012 to 2014 4STAR participated in four major field campaigns: the U.S. Dept. of Energy’s TCAP I & II campaigns, and NASA’s SEAC4RS andARISE campaigns. Establishing a strong performance record, 4STAR operated successfully on all flights conducted during each of these campaigns. Sky radiance data from scans in either constant azimuth (principal plane) or constant zenith angle (azimuthal) were interspersed with direct beam measurements during level legs. During SEAC4RS and ARISE, 4STAR airborne measurements were augmented with flight-level albedo from the colocated Shortwave Spectral Flux Radiometer (SSFR) providing improved specification of below-aircraft radiative conditions for the retrieval.

Calibrated radiances and retrieved products will be presented with particular emphasis on comparisons between ambient SSA retrievals SEAC4RS and comparisons between 4STAR and AERONET.

What is 4STAR?

What is next for 4STAR?

• Current AITT funding to improve calibration stability and implement mechanical/optical improvements
• Selected for KORUS-AQ 2016
• Selected for ORACES 2016-2020
• Explore new calibration approach to eliminate relative biases even between direct beam and sky radiance measurements.
• Implement vectorized radiative transfer code to speed sky scan retrieval for N-wavelengths.
• Hyperspectral cloud-properties retrievals in development (demonstrated in NAAMES)
• Build more 4STARS!
