GUIDELINES AND SUGGESTIONS FOR BALLOON GONDOLA DESIGN

MAY 16-18 2017
HUGO FRANCO
DESIGN REQUIREMENTS

- **STRUCTURAL INTEGRITY**
  - Primarily to survive termination event
    - Safety
    - Mission assurance
  - Has been sufficient for landing – Although not a CSBF requirement

- **LAUNCHABILITY**
  - Important to prevent damage
  - Allows for less than ideal launch conditions

- **STAGING/PICKUP**
  - Must be able to fit inside existing high bays
  - Allows for hoist pickup and roll out to launch vehicle

- **RECOVERY**
  - Some existing recovery limitations – Particularly Antarctica
  - Crucial to stay within limitations for critical components
STRUCTURAL REQUIREMENTS

● **10G VERTICAL – 5 G SIDE LOAD**
   - Based on ultimate load of the material (not yield)
   - Intended to prevent freefall of components

● **ROTATOR**
   - Critical Component
     - Single point failure
     - Watch for concentration factors

● **SUSPENSION LINES (WHERE APPLICABLE)**
   - Great historical data for steel cables
   - Have used synthetic systems before to save weight – Kevlar, Spectra
     - UV a concern, one time use perhaps

● **STRUCTURAL MEMBERS**
   - Mostly made of Aluminum or other lite tough metals
   - Have flown Carbon Fiber/metal hybrids
     - Still learning to test and approve for certification
**LAUNCHABILITY**

- **PAYLOAD MUST BE ABLE TO SURVIVE LAUNCH**
  - These are dynamic launches
    - Damage to antennae, solar panels or other protruding objects
    - Sensitive equipment can be damaged
    - Latching mechanisms

- **MINIMUM DESIRED DISTANCES FROM LAUNCH VEHICLE**
  - “20 degree rule” – Assures minimum desired clearance Launch Vehicle
  - 6 ft. of ground clearance – Avoids contact with ground
  - 5 ft. of clearance from front end of vehicle – Avoids contact with front end of vehicle during launch

- **OTHER OBSERVATIONS**
  - Width/Length of payload – High MOI
  - Wide sections near the boom (higher)
    - Risk of contact with boom and damage
Staging/Gondola Pickup

- Facilities Limitations
  - Height/Width of payload
    - Allow for weighing the payload inside the building (Antarctica)
    - Allow for ease of roll in/and out of building

- Cart/Wheels
  - Allows people to work underneath
  - Ideally allows for ballast hoppers and solar panels to stay attached for roll out.
    - Huge time saver
  - Must be big enough for easy rollout
  - Must allow rotation of payload for vehicle pickup
GONDOLA DISASSEMBLY

- Critical components to stay within a certain allowable size and weight
  - Limited by recovery vehicle
    - Helo
    - Twin Otter and Bassler (Antarctica)
    - Land Vehicles

- Easy/Quick Disassembly
  - Allows for quicker recovery - Antarctica
  - Data vaults and other critical components accessible
    - Trade off between access and protection
COMMON PITFALLS AND RECOMMENDATIONS

● WAITING TOO LONG TO CONTACT CSBF
  ➢ The sooner the better on gondola design
  ➢ Pointing systems are critical and expensive components
    – The sooner we see the design the better
  ➢ Placing CSBF equipment in appropriate location
    – Thermal considerations
    – Antenna placement

● PROVIDING ANALYSIS FOR MAXIMUM WEIGHT
  ➢ Final weights are usually higher than predicted
    – Avoids rerunning the analysis if overweight

● PROTECTIVE CAGE FOR SIP

● NO APPROPRIATE CASTERS/TIRES
  ➢ Hard to maneuver
