Crop Considerations for Space

- High yielding and nutritious (CHO, protein, fat, micronutrients)
- High harvest index (edible / total biomass)
- Horticultural requirements
  - planting, watering, harvesting, pollination, propagation
- Environmental requirements
  - lighting, temperature, mineral nutrition, CO₂
- Processing requirements
- Dwarf or low growing types
### Some Crops for Life Support

* Approximate values.

** Tungsten halogen lamps have broader spectrum.

*** For VHO lamps; lower power lamps with electronic ballasts last up to ~20,000 hrs.

**** State-of-Art Blue and Red LEDs most efficient.
**Light Emitting Diodes (LEDs)**

- **Red**...photosynthesis
- **Blue**...photomorphogenesis

Some Lessons Learned from NASA CEA Research

- 20-25 m² of crops could provide all the O₂ for one person, and 40-50 m² all of the food (dietary energy)
- Better adapted crops are needed—short growth, high harvest index, improved nutrition—Use genetic engineering?
- Lighting is key to sustaining high yields
- CEA systems require large quantities of water (e.g., 5 L m⁻² d⁻¹) and this water must be recycled.
- Up to 90 kg of fertilizer would needed per person per year, emphasizing the need for recycling nutrients.
- Plants can provide psychological benefits to humans—this needs further study.
- The use of plants for life support will likely evolve sequential, starting with small, supplemental food production and expanding for future missions.
As we explore sustainable living for space, we will learn more about sustainable living on Earth.
One of our Kennedy Space Center Researchers!

Michelle McKeon-Bennett, 2004, Space Life Science Laboratory, KSC, Florida
Effect of Light on Productivity and Crop Area Requirements

- **Light or PAR (mol m\(^{-2}\) day\(^{-1}\))**
- **Productivity (g m\(^{-2}\) day\(^{-1}\))**
- **Area Required (m\(^{2}\) / person)**
