The South/Southeast Asia Research Initiative (SARI) Update and Meeting Objectives

Krishna Prasad Vadrevu, NASA Marshall Space Flight Center, Alabama

Abstract

Land Use/Cover Change (LU/CC) is one of the most important types of environmental change in South and Southeast Asian countries. Several studies suggest that LU/CC in these countries is in large part driven by population growth and economic development. In the region, changes that are most common include urban expansion, agricultural land loss, land abandonment, deforestation, logging, reforestation, etc. To address the research needs and priorities in the region, a regional initiative entitled South Southeast Asia Regional Initiative (SARI) has been developed involving US and regional scientists. The initiative is funded by NASA Land Cover, Land Use Change program. The goal of SARI is to integrate state-of-the-art remote sensing, natural sciences, engineering and social sciences to enrich LU/CC science in South Southeast Asian countries. In the presentation, LU/CC change research in SARI countries will be highlighted including the drivers of change. For example, in South Asia, forest cover has been increasing in countries like India, Nepal and Bhutan due to sustainable afforestation measures; whereas, large-scale deforestation in Southeast Asian countries is still continuing, due to oil palm plantation expansion driven by the international market demand in Malaysia and Indonesia. With respect to urbanization, South and Southeast Asian countries contain 23 megacities, each with more than 10 million people. Rapid urbanization is driving agricultural land loss and agricultural intensification has been increasing due to less availability of land for growing food crops such as in India, Vietnam, and Thailand. The drivers of LUCC vary widely in the region and include such factors as land tenure, local economic development, government policies, inappropriate land management, land speculation, improved road networks, etc. In addition, variability in the weather, climate, and socioeconomic factors also drive LU/CC resulting in disruptions of biogeochemical cycles, radiation and the surface energy balance of the atmosphere. The presentation will also highlight SARI collaborative activities with space agencies, universities and non-government organizations including data sharing mechanisms in the region.
The South/Southeast Asia Research Initiative (SARI) Update and Meeting Objectives

• Background to the SARI initiative

• Meeting Objectives
How it started - strong interest in a SARI from local scientists

Jan-10-13th, 2013- Regional Science Meeting, Coimbatore

Total participants = 120

US – 18 researchers
Nepal- 3; Srilanka-2; Myanmar-1; Afghanistan, Myanmar, Bangladesh-1 each
Pakistan, China invited but could not attend – Visa issues

India – University Researchers, Government, Non-Government, NGO’s
Meeting Summary—Need for SARI
NASA The Earth Observer

Summary of the 2013 NASA Land Cover/Land Use Change Regional Science Meeting, South India

Introduction
The 2013 NASA Land Cover/Land Use Change (LCLUC) Regional Science Meeting was held in South India and had three components:

- a focused workshop on water resources at the Centre for Water Resources Development and Management (CWRED), held in Kottakkal, Kerala, India, from January 7-8, and a Land Use/Land Cover Transect Study from Kottakkal, Kerala, to Coimbatore, Tamil Nadu, in India, on January 9;
- a NASA international regional meeting held January 10-15, at Kanpur University in Kanpur, Uttar Pradesh, and
- a training workshop titled Remote Sensing and Geospatial Technologies for Land Cover and Land Use Change Studies and Applications, held January 14 at Kanpur University.

The goal of the meeting was to discuss land cover/land use change (LCLUC) issues and impact in the South Asia region. The meeting was organized around eight technical sessions:

1. Agricultural land use change;
2. LCLUC-enabled Earth observations (missions, data, and products);
3. Atmospheric land-use interactions (agroecosystems, greenhouse gases);
4. LCLUC and the carbon cycle;
5. Forestry and LCLUC in mountainous areas;
6. Coastal zones and water resources;
7. Urban LCLUC; and
8. Working towards a Regional Global Observation for Forestry and Land Cover Dynamics (GOFC-GOLD) South Asia Regional Information Network (SARIN) (including prospects, opportunities, and challenges).

The meeting was a joint effort of the NASA LCLUC Program, GOFC-GOLD Program, International System for Analysis Research and Training (START) Program, Monsoon Asia Integrated Regional Studies Program (MAIRS); University of Maryland College Park (UMD), Centre for Water Resources Development and Management (CWRED) in Kottakkal, Kerala; and Kanpur University in Kanpur, Uttar Pradesh.

NASA LCLUC Workshop on Water Resources and Land Use Transect

Thirty top-level delegates from different institutions and universities in India attended the meeting in addition to twelve researchers from the U.S. National Polar Observatory (CWRED), welcomed the participants and highlighted the CWRED water research activities.

After the welcome, Girish Gomani (NASA Headquarters) addressed the workshop’s participants, presenting an overview of LCLUC issues in South Asia, with focus on agricultural land cover conversion.

On January 8, participants departed for a Land Use Transect Study from Kottakkal, Kerala, to Coimbatore, Tamil Nadu, involving local scientists. The traverse of urban expansion and forest degradation were quite evident during the transect study. During the traverse, the participants observed forest fires in the mountains, 50 km (31 ml) away from Coimbatore.

SARI - Goal

SARI is NASA LCLUC Program funded regional initiative

To develop an innovative research, education, and capacity building program involving state-of-the-art remote sensing, natural sciences, engineering and social sciences to enrich LCLUC science in South/Southeast Asia.
Involving National Researchers and Practitioners – Universities, Institutes and Operational Agencies;

Strong emphasis on Applied Research with regional / national societal applications and benefits.

Facilitate strengthening regional/national projects through co-design and collaborations;
SARI Regional Needs Meetings funded by NIES, Japan and several international/regional partners
Collaborations are the Key!
SARI Agriculture Meeting – New Delhi

- Total Meeting Participants = 94
- Total Presentations = 42
- Meeting Outputs – IJRS Special Issue
South/Southeast Asian countries are growing rapidly in terms of population, industrialization and urbanization. One of the key challenges in the region is food security. Although total food production and productivity has increased in the region because of additional land area converted to agricultural land use during 1960’s to 2000 and improved varieties and crop management, growth rate of food production in recent times has slowed down, mostly due to loss of agricultural lands related to increasing urbanization and industrialization and less optimal use of available technology. Further, the weather and climate systems in the region, driven primarily by monsoon variability are characterized by extreme weather events, resulting in droughts or flooding which can impact agricultural production. In this region, monitoring the agricultural crop production in a timely manner is essential to predict and prepare for disruptions in the food supply. Further, improved and up-to-date information on agricultural land cover and associated land use practices can help in understanding the role and response of the agricultural sector to environmental change and for improved land management and planning.

Despite the progress in remote sensing and geospatial technologies, little emphasis has been placed on developing robust methods for operational mapping/monitoring of cropped areas and forecasting crop production. In most countries of South/Southeast Asia, the mapping efforts have focused on the classification of land cover types and generalize cropland areas into a single or limited number of thematic classes. Crop-specific HUC information is currently limited to very few countries in

Countries and Meeting Objectives
Agricultural land use in South/SE Asia

Significant increase in Agricultural Land Area (x 1000ha) in Several South and Southeast Asian Countries

Vadrevu et al., 2017, ERL (in press)

Data Source: FAO, 2015
Agriculture

- Long-term Food Security is a major concern for the region;

- Agricultural production and land use is changing
  - Crop water requirements;
  - Extreme events (flooding and drought (almost every year!))
  - Adaptation options needs to be explored to address food security questions

- RS data needed to monitor agriculture (within season) and forecast crop production
  (integrating Landsat+ Sentinel + other high resolution data);

- Transitioning from research to operational products
  - 3-year research projects (eg: 6-different teams working on Rice mapping in Mekong; coordination required and transitioning from research to operations;
    - Crop type and area statistics
    - Production estimates
    - Yield forecasting
      - GEOGLAM working on some of the above activities.
1997-2016 – possible because of strong validation data at a plot scale from Farm service bureau; such data may not be available in S/Seast Asia
Significant decrease in Forest Area (x 1000ha) in Several South and Southeast Asian Countries
Vadrevu et al., 2015, ERL (in review)

Data Source: FAO, 2015
Urbanization is occurring rapidly at the cost of agriculture and forest lands.

Currently, 28.33% of South/Southeast Asian population lives in urban areas and it is estimated that by 2030, more than 55% of the population will be urban.

Urban sprawl has been increasing in different cities at the cost of agricultural lands, ecologically sensitive and natural areas.

Increasing Urbanization is resulting in air, water and solid waste pollution problems in most cities.

LCLUC interactions in urban environments are poorly understood and need immediate attention.
Nearly 60% of world's population is in Asia (4.5 billion people)
Nearly 2/3rd of world population growth is in Asia
Nearly 50 million people are being added every year!
**GHG emissions from LUCF in South Asia**

GHG emissions from LUCF sector seems decreasing significantly in South Asia

Vadrevu et al., 2015, ERL (in review)
GHG emissions from LUCF sector seems decreasing in Southeast Asia too, however, not rapidly as in South Asia.

Some of the drivers to be discussed in this meeting.
Population and Energy Use

Consumption of Oil by Asian Countries
Consumption figures are in thousand barrels per day.

Top Ten Coal Consumers of Asia
Figures are in thousand short tons.

China: 3,976,116
India: 801,030
Japan: 203,846
South Korea: 136,482
Indonesia: 75,784
Taiwan: 72,377
Thailand: 41,500
Pakistan: 6,776
Philippines: 18,659
Malaysia: 25,632

Fires and smoke in Indonesia (6/19/2016) – Also a Recurring Event
Fires, Riau province, Indonesia, June, 2013, 2016
Meeting Focus

- Review regional and national science initiatives, relating to LCLUC in the region;
- Review the causes and impacts of LCLUC specific to agriculture, forests, urban and coastal ecosystems in the Asian region;
- Review GHG and SLCP emission estimates from different sources in the Asian region;
- Review latest updates on atmospheric correction algorithms;
- Review latest research specific to aerosols; biomass burning and emissions modeling;
- Strengthen the SARI activities in the region.
Meeting Sessions

- **Session-1** – Agricultural Land Use/Cover Changes
- **Session-2** – Land Atmospheric Interactions
- **Session-3** – Urban Land Use/Cover Changes
- **Session-4** – Forest Land use/Cover Changes
- **Dedicated Poster Session**
- **Panel Discussions (Day-2)**: Research needs;
- **Discussion Session (Day-3)**: User needs and priorities.
Current Meeting Outputs

Special Issue:

Remote Sensing of Land Use/Cover Changes (LU/CC) in South/Southeast Asia

-Andreas Heinimann (Univ. of Bern, Switzerland)
-Chris Justice (Univ. of Maryland, USA)
-Garik Gutman (NASA HQ)

Deadline: March 31st, 2018
Welcome to SARI

The goal of SARI is to develop an innovative regional research, education, and capacity building program involving state-of-the-art remote sensing, natural sciences, engineering and social sciences to enrich Land Cover/Land Use Change (LCLUC) science in South Asia. Our objectives are twofold. First, we aim to advance LCLUC science in the region. Second, we endeavor to strengthen existing and build new collaborations between US and South Asia researchers in the areas of LCLUC research. To address LCLUC science, SARI will utilize a systems approach to problem-solving that examines both biophysical and socioeconomic aspects of land systems, including the interactions between land use and climate and the interrelationships among policy, governance, and land use. A central component of this initiative will be the use of geospatial data from both remotely sensed and in situ sources and models. To strengthen the theoretical underpinnings of LCLUC science in the South Asian region, SARI will facilitate:

a) new partnerships with space agencies, universities and non-government organizations;
b) novel and regionally-appropriate methodologies and algorithms for LCLUC products;
c) data sharing mechanisms;
d) leadership training;
e) international workshops to identify regional priorities, discuss and share scientific findings;
f) capacity building programs; and
g) international student/researcher exchanges, including among LCLUC scientists in the region.

SARI will serve as a facilitator and catalyst for LCLUC research in South Asia. The outputs will be beneficial to the U.S., South Asia and international researchers and will serve as a model for interdisciplinary research that links LCLUC science with NASA assets.
