Weather from 250 Miles Up: 
Visualizing Precipitation Satellite Data (and Other 
Weather Applications) using CesiumJS

August 16, 2017

Matt Lammers (matthew.r.lammers@nasa.gov)
Senior Science Data Visualization Analyst/Software Engineer
Who Am I?

I maintain the STORM data portal for Global Precipitation Measurement (GPM) Mission satellite data at NASA Goddard.
Who Am I?

I maintain the STORM data portal for Global Precipitation Measurement (GPM) Mission satellite data at NASA Goddard. Before this, I worked at MesoWest (University of Utah) building APIs and visualizations using surface weather observations.
Who Am I?

Before this I worked at MesoWest (University of Utah) building APIs and visualizations using surface weather observations.
What Data Do I Use?

HDF5 files from low-Earth orbit microwave imager/sounders and radars
What Data Do I Use?

HDF5 files from low-Earth orbit microwave imager/sounders and radars

Most of the time, the data are stored by the swath
What Data Do I Use?

HDF5 files from low-Earth orbit microwave imager/sounders and radars

Most of the time, the data are stored by the swath

Sometimes it’s on a latitude-longitude grid
What Data Do I Use?

Variables include brightness temperature, reflectivity, precipitation phase, and precipitation rate.

Some demos I will be showing also include model output of wind speed and reflectivity, as well as modeled tracers of air quality.
What Tool Do I Use?

CesiumJS!

Source: The East Japan Earthquake Archive
What Tool Do I Use?

CesiumJS!
What Tool Do I Use?

CesiumJS!
When I came to NASA, project scientists were making decisions about data acquisition based on static images.
What Motivates This Work?

Files could be ingested into THOR data viewer tool, but visualization was limited to two dimensions.

With Near Real Time data, they had no ability to preview files.
One day, I saw this demo in the Cesium showcase...
If Cesium could handle weather model data like that, I could use the same principles to display precipitation satellite information.
What Motivates This Work?

One approach is to use image tiles, which remains 2D, but can still be placed on a 3D globe.
So where did I start? Near Real Time Data...

https://storm.pps.eosdis.nasa.gov/storm/cesium/GPMNRTViewer.html
GPM Near Real Time Viewer
GPM Near Real Time Viewer
- Post-Processed HDF5 into CZML (Cesium Markup Language), storing a rolling 24 hours of data
- Post-Processed HDF5 into CZML (Cesium Markup Language), storing a rolling 24 hours of data

- Each 5-/6-minute segment is stored as a series of points that are time dynamic. Cesium interpolates between the points and colors to present smooth transitions.
Post-Processed HDF5 into CZML (Cesium Markup Language), storing a rolling 24 hours of data.

- Each 5-/6-minute segment is stored as a series of points that are time dynamic. Cesium interpolates between the points and colors to present smooth transitions.

- Each scan time, the point positions/colors are dumped out and stored as the satellite and time dynamic points move forward. These dumped points are erased after 15 minutes of scan.
GPM Near Real Time Viewer

A close-up to illustrate how this process works...
Moving on to “production” data, and STORM Virtual Globe

What about really important, high impact events?

https://storm.pps.eosdis.nasa.gov/storm/cesium/EventViewer.html
STORM Event Viewer

With tens of thousands of GPM orbits, isolating the ones that contain high-impact events is a priority.
STORM Event Viewer

Three ways “Events” get selected:
Three ways “Events” get selected:

- I performed a massive survey collocating GPM overflights with tropical cyclones
Three ways “Events” get selected:

- I performed a massive survey collocating GPM overflights with tropical cyclones.

- I see events occurring in the NRT Viewer and isolate them for preservation in the Event Viewer.
STORM Event Viewer

Three ways “Events” get selected:
