5 Conclusion
Software development

- Software represent more than half of the development cost of an aircraft
- Regulated by international standards (DO-178 rev. B/C)
Software development

- Software represent more than half of the development cost of an aircraft
- Regulated by international standards (DO-178 rev. B/C)
- Tests
  - Expensive because run on a special hardware
  - Can miss bugs
  - Slow
Software represent more than half of the development cost of an aircraft

Regulated by international standards (DO-178 rev. B/C)

Tests
  - Expensive because run on a special hardware
  - Can miss bugs
  - Slow

Solution: use static analysis

NASA V&V program
Safety properties

- Main objectives: no runtime errors
  - buffer overflow
  - null dereference
  - division by zero
  - integer overflow
- Harder objectives:
  - assertions (pre/post invariants)
  - termination
- certified $\Rightarrow$ soundness is required
- abstract interpretation is a good candidate
- runtime errors can be security vulnerabilities!
Abstract Interpretation

- based on the concrete semantics of your program
- automatic formal proof
- sound approximation of reachable states
Abstract Interpretation

Possible trajectories

$x(t)$

$semantics(P)$

$\mathit{P}$
Abstract Interpretation

2. IKOS
   - Project
   - Toolchain
   - Demo
   - Results

3. Analyses

4. Miscellaneous

5. Conclusion
The IKOS project

- Inference Kernel for Open Static Analyzers
- C++ library for abstract interpretation
- C/C++ static analyzer
- Target embedded systems
- Analyses:
  - Buffer overflow
  - Division by zero
  - Null dereference
  - Uninitialized variables
  - Prover
- [https://ti.arc.nasa.gov/opensource/ikos/](https://ti.arc.nasa.gov/opensource/ikos/)
Toolchain

- C/C++ code
- clang
- LLVM IR

Ikos-pp
- Ikos-pp is an executable that embeds the LLVM opt command. It applies several LLVM built-in optimizations + our own optimization passes to produce an intermediate optimized LLVM IR. Using the optimized LLVM IR, we run LLVM opt command with -arbos option to translate the optimized LLVM IR to AR
- ikos-pp does at least the following optimizations before translating to AR: -mem2reg, -loweratomic, -lowerswitch, and -instnamer

AR Plugin Analyzers
- BOA - buffer overflow analysis
- DBZ - Intra-procedural integer division-by-zero analysis
- UVA - Inter-procedural uninitialized variable + array analysis
- NullPtr - Inter-procedural null dereference pointer analysis

ARBOS
{AR parser, analysis plugin framework}
- Outputs reports to console
- IKOSView: desktop GUI that queries results stored in SQLite3 database
- Integrated into web services (such as continuous build + bug tracking systems)
  - SonarQube – using sonar_runner
  - CodeDX – import results in cppcheck XML format
  - SWAMP – used in cybersecurity

Abstract Domains
- Interval
- Constants
- Discrete
- Congruence
- Interval + Congruence
- Octagons
- Difference Bounds Matrix
- Pointer Analysis
- Low Level Virtual Machine
- Compiler Infrastructure
- Generic assembly language
- Allow language independent optimization
- Low Level Virtual Machine
- Compiler Infrastructure
- Generic assembly language
- Allow language independent optimization

```
C     C++     Fortran    Ada

llvm bitcode

x86   PowerPC  ARM    AR
```
$ cat test.c

#include <stdio.h>

int main(int argc, char** argv) {
    int a[10];
    int i;
    for (i = 0; i < 10; i++) {
        a[i] = i;
    }
    printf("%d\n", a[i - 1]);
    printf("%d\n", a[0]);
    return 0;
}
$ clang -c -emit-llvm -O1 -o test.bc test.c
$ opt -S test.bc

IKOS pre-processor

Run llvm optimization passes:

- mem2reg : SSA Form
- globaldce : Dead Code Elimination
- globalopt : Global Variable Optimizer
- simplifycfg : Control Flow Graph Optimizer
- scalarrepl : Scalar Replacement of Aggregates
- sccp : Sparse Conditional Constant Propagation
- loop-simplify : Canonical Form for Loops
- lcssa : Loop Closed SSA Form
- loop-deletion : Dead Loop Elimination
- lowerinvoke : Lower Invoke Instructions
- lowerswitch : Lower Switch Instructions

Run home made llvm passes:

- Lower Global Variable Initialization
- Lower Constant Expressions
- Lower Select Instructions
- Name Values
Abstract Representation

Major differences with llvm:
- Branching instructions are translated into assertions
- Memory instructions are byte oriented
- Some instructions are removed

Translation from llvm to AR using a llvm pass

Text representation using s-expressions

main.26 = call printf(main.25, main.24)
return 0
Analyzer

- Liveness analysis
- Pointer analysis
- Memory analysis combining:
  - Numerical analysis
  - Pointer analysis
  - Uninitialized variable analysis
  - Null pointer analysis
- Checkers:
  - buffer overflow
  - division by zero
  - null dereference
  - uninitialized variables
  - assertion prover
- Store results in a SQLite database
The toolchain is launched via a python script

Generate reports in different formats:
  - Console (gcc style)
  - JSON
  - XML
  - etc.

Output database reusable (using *ikos-render*)
Toolchain

**Tool Chain Execution Flow**

- C/C++ code
- clang
- LLVM IR
- ikos-pp
- Optimized LLVM IR
- LLVM opt command + AR pass (-arbos)
- AR in s-expr

**IKOS**
- Abstract Domains
  - Interval
  - Constants
  - Discrete
  - Congruence
  - Interval + Congruence
  - Octagons
  - Difference Bounds Matrix
  - Pointer Analysis

**ikos-pp**
- Ikos-pp is an executable that embeds the LLVM opt command. It applies several LLVM built-in optimizations + our own optimization passes to produce an intermediate optimized LLVM IR. Using the optimized LLVM IR, we run LLVM opt command with `-arbos` option to translate the optimized LLVM IR to AR.
- ikos-pp does at least the following optimizations before translating to AR:
  - `-mem2reg`, `-loweratomic`, `-lowerswitch`, and `-instnamer`

**AR Plugin Analyzers**

Pointer analysis: What memory locations can a pointer expression refer to?

Alias analysis: Are two pointers referring to the same locations?

Intraprocedural vs Interprocedural

Flow sensitive vs Flow insensitive

Context sensitive vs Context insensitive
How to model memory locations?

- Global variables: use symbolic names (e.g., `g`)
- Local variables: use symbolic names (e.g., `main.x`)
- Dynamically allocated memory: use symbolic names?
  - Problem: potentially unbounded locations (think about a loop)
  - Solution: use symbolic names with an instruction counter (e.g., `blk(l, λ)`)

Maxime Arthaud
Andersen’s pointer analysis

For each pointer \( p \), we call \( T_p \) the set of memory locations pointed by \( p \)

Goal : find \( T_p \) for each pointer \( p \)

Idea : view pointer assignments as subset constraints

Complexity : \( O(n^3) \), worst case \( O(n^4) \)
Andersen’s pointer analysis

For each pointer \( p \), we call \( T_p \) the set of memory locations pointed by \( p \)

Goal: find \( T_p \) for each pointer \( p \)

Idea: view pointer assignments as subset constraints

Complexity: \( O(n^3) \), worst case \( O(n^4) \)

- \( p = &x \iff T_p \supseteq \{x\} \)
- \( p = q + o \iff T_p \supseteq T_q \)
- \( p = *q \iff T_p \supseteq *T_q \iff \forall x \in T_q, T_p \supseteq O(x) \)
- \( *p = q \iff *T_p \supseteq T_q \iff \forall x \in T_p, O(x) \supseteq T_q \)
Andersen’s pointer analysis

For each pointer \( p \), we call \( T_p \) the set of memory locations pointed by \( p \)

Goal: find \( T_p \) for each pointer \( p \)

Idea: view pointer assignments as subset constraints

Complexity: \( O(n^3) \), worst case \( O(n^4) \)

\[ p = \& x \iff T_p \supseteq \{ x \} \]
\[ p = q + o \iff T_p \supseteq T_q \]
\[ p = \ast q \iff T_p \supseteq \ast T_q \iff \forall x \in T_q, T_p \supseteq O(x) \]
\[ \ast p = q \iff \ast T_p \supseteq T_q \iff \forall x \in T_p, O(x) \supseteq T_q \]

How to solve the constraints system? A fix point, of course!
Example:

- $p = &a$
- $q = &b$
- $*p = q$
- $r = &c$
- $s = p$
- $t = *p$
- $*s = r$
Example:

- $p = \&a \iff T_p \supseteq \{a\}$
- $q = \&b \iff T_q \supseteq \{b\}$
- $*p = q \iff *T_p \supseteq T_q$
- $r = \&c \iff T_r \supseteq \{c\}$
- $s = p \iff T_s \supseteq T_p$
- $t = *p \iff T_t \supseteq *T_p$
- $*s = r \iff *T_s \supseteq T_r$

Exercice: solve it!
Solution:

- $T_p = \{a\}$
- $T_q = \{b\}$
- $T_r = \{c\}$
- $T_s = \{a\}$
- $T_t = \{b, c\}$
- $O(a) = \{b, c\}$
- $O(b) = \emptyset$
- $O(c) = \emptyset$
Steensgaard’s pointer analysis

Idea: view pointer assignments as equality constraints

Question: Is it more or less precise? Why?

Question: Complexity?
Steensgaard’s pointer analysis

Idea: view pointer assignments as equality constraints

- \( p = \& x \iff T_p \supseteq \{x\} \)
- \( p = q + o \iff T_p = T_q \)
- \( p = *q \iff T_p = *T_q \iff \forall x \in T_q, T_p = O(x) \)
- \( *p = q \iff *T_p = T_q \iff \forall x \in T_p, O(x) = T_q \)
Steensgaard’s pointer analysis

Idea: view pointer assignments as equality constraints

- $p = \& x \iff T_p \supseteq \{x\}$
- $p = q + o \iff T_p = T_q$
- $p = *q \iff T_p = *T_q \iff \forall x \in T_q, T_p = O(x)$
- $*p = q \iff *T_p = T_q \iff \forall x \in T_p, O(x) = T_q$

Question: Is it more or less precise? Why?
Question: Complexity?
Steensgaard is less precise than Andersen’s algorithm
Each equality constraint is equivalent to 2 inclusion constraints
Steensgaard’s constraints system include Andersen’s constraints
Think fix point: once you reached Andersen’s system fix point solution, you will keep growing to satisfy equality constraints
Complexity: $O(n \log(n))$ (process each constraint once using union-find)
Solution:

- \( T_p = T_s = \{a\} \)
- \( T_q = T_t = T_r = O(a) = \{b, c\} \)
- \( O(b) = \emptyset \)
- \( O(c) = \emptyset \)
IKOS uses Andersen’s approach

Based on Arnaud Venet’s paper: « A Scalable Nonuniform Pointer Analysis for Embedded Programs », SAS 2004

Compute points-to set (Andersen) and offset (Intervals) for each pointer

\[ \mathcal{D}^\# = \mathcal{P} \rightarrow (\mathcal{A} \cup \{\top\}) \times \mathcal{I} \]

Interprocedural

Flow insensitive

Context insensitive
Memory analysis (also called Value analysis) based on a reduced domain product of:

- Numerical domain for integers (by default, intervals)
- Pointer domain
- Null pointer domain
- Uninitialized variable domain
- Floating points are currently ignored

Based on Antoine Mine’s paper: « Field-Sensitive Value Analysis of Embedded C Programs with Union Types and Pointer Arithmetics », LCTES’06

- Interprocedural
- Context sensitive
Memory analysis - Pointer domain

- Pointer abstract domain
- $\mathbb{D}^\#_p = V \rightarrow (A \cup \{T\}) \times I$
- Pointwise order $\sqsubseteq^\#_p$, Pointwise union $\sqcup^\#_p$
- $(\mathbb{D}^\#_p, \sqsubseteq^\#_p, \sqcup^\#_p)$ is a lattice
- Galois connection $(\alpha_p, \gamma_p)$ with the concrete semantics
- Reduction with the previous flow-insensitive pointer analysis
Abstract operations:

- $[p = \& x]#(\rho) = \rho \downarrow (\{x\}, [0, 0])$
- $[p = q + o]#(\rho) = \rho \downarrow (\text{addresses}(\rho(q)), \text{offsets}(\rho(q)) + o)$
- $[*p = q]#(\rho) = \rho$
- $[[p = \ast q]#(\rho) = \rho \downarrow (T, ]-\infty, +\infty[)]$
Abstract operations:

- \([p = \& x] \#(\rho) = \rho [p \rightarrow (\{x\}, [0, 0])]\)
- \([p = q + o] \#(\rho) = \rho [p \rightarrow (\text{addresses}(\rho(q)), \text{offsets}(\rho(q)) + o)]\)
- \([*p = q] \#(\rho) = \rho\)
- \([p = *q] \#(\rho) = \rho [p \rightarrow (\top, ]-\infty, +\infty[)]\)

Question : \([p == q] \#(\rho) = ?\)

Question : \([p \neq q] \#(\rho) = ?\)
Null pointer abstract domain

\[ D_n = \{ \bot, \text{Null}, \text{NonNull}, \top \} \]

\[ D_n^\# = \forall \rightarrow D_n \]

\[ \bot \sqsubseteq^# \text{Null}, \bot \sqsubseteq^# \text{NonNull}, \text{Null} \sqsubseteq^# \top, \text{NonNull} \sqsubseteq^# \top \]

\[ \text{Null} \sqcup_n^# \text{NonNull} = \top \]

\[ (D_n^\#, \sqsubseteq^#, \sqcup_n^#) \text{ is a lattice} \]

Galois connection \((\alpha_n, \gamma_n)\) with the concrete semantics
• Uninitialized variable abstract domain
• $D_u = \{\perp, Init, Uninit, \top\}$
• $\mathbb{D}^\#_u : \forall \to D_u$
• $\perp \sqsubseteq^\#_u Init$, $\perp \sqsubseteq^\#_u Uninit$, $Init \sqsubseteq^\#_u \top$, $Uninit \sqsubseteq^\#_u \top$
• $Init \sqcup^\#_u Uninit = \top$
• $(\mathbb{D}^\#_u, \sqsubseteq^\#_u, \sqcup^\#_u)$ is a lattice
• Galois connection $(\alpha_u, \gamma_u)$ with the concrete semantics
Question: how to model the memory?
LLVM is low level, a byte representation is necessary
The C language is not type safe and is very permissive on casts
Question: how to model the memory?

LLVM is low level, a byte representation is necessary

The C language is not type safe and is very permissive on casts

We need to model correctly the following code:

```c
uint64_t x = 1;
uint32_t* p = (uint32_t*)&x;
p += 1;
uint32_t y = *p;
```

By the way, what is y’s value?
Memory model from « Formalizing the LLVM Intermediate Representation for Verified Program Transformations », POPL 2012

Memory cell \( mc = \text{mb}(\text{size}, \text{byte}) \) \\
\( \text{mptr} (\text{blk}, \text{offset}, \text{index}) \) \\
\( \text{muinit} \)

- Memory state = \( (N, B, C) \)
- \( N \): next block id
- \( B = \mathbb{Z}^+ \rightarrow \mathbb{Z}^+ \) : block id to block size (bytes)
- \( C = \mathbb{Z}^+ \times \mathbb{Z}^+ \rightarrow \mathbb{MC} \) : (block id, offset in bytes) to memory cell
Example:

```c
int* p = (int*) malloc(sizeof(int) + sizeof(int*));
*p = 0x01020304;
int** q = (int**)(p + 1);
*q = p + 2;
```
Memory analysis - Memory model

Example:

```c
int* p = (int*) malloc(sizeof(int) + sizeof(int*));
*p = 0x01020304;
int** q = (int**)(p + 1);
*q = p + 2;
```

<table>

</tbody>
</table>

By the way, what architecture could it be?
Memory abstract domain

Based on Antoine Mine’s paper: « Field-Sensitive Value Analysis of Embedded C Programs with Union Types and Pointer Arithmetics », LCTES’06

Idea: abstract memory using cells: \( C(\text{address}, \text{offset}, \text{size}) \)

Each cell is considered as a variable in the underlying abstract domain

Cells may overlap

\[ C = A \rightarrow \mathbb{Z}^+ \times \mathbb{Z}^+ \]

\[ D^\#_{\text{mem}} = C \times D^\#_{\text{underlying}} \]

In IKOS, \[ D^\#_{\text{underlying}} = D^\#_{\text{num}} \times D^\#_{\text{ptr}} \times D^\#_{\text{null}} \times D^\#_{\text{unini}} \]

Pointwise partial order, Pointwise union
Abstract operations: forward to $\mathbb{D}_{\text{underlying}}^\#$, except memory read and write.

Memory write:
- set to $\bot$ if $p$ is null or uninitialized
- $(\text{points\_to, offset}) = \rho(p)$
- $\text{cells} = \text{realize\_write}(\text{points\_to, offset})$
- $\forall c \in \text{cells}, \text{strong\_update}(c, \text{rhs})$ or $\text{weak\_update}(c, \text{rhs})$

Memory read:
- set to $\bot$ if $p$ is null or uninitialized
- $(\text{points\_to, offset}) = \rho(p)$
- $\text{cells} = \text{realize\_read}(\text{points\_to, offset})$
- $\forall c \in \text{cells}, \text{strong\_update}(\text{lhs, c})$ or $\text{weak\_update}(\text{lhs, c})$
Example:

```c
int* p = (int*) malloc(sizeof(int) + sizeof(int*));
*p = 0x01020304;
int** q = (int**)(p + 1);
*q = p + 2;
```
Example:

```c
int* p = (int*) malloc(sizeof(int) + sizeof(int*));
*p = 0x01020304;
int** q = (int**)(p + 1);
*q = p + 2;
```

Abstract value at the end:

\[
(malloc \rightarrow \{\{0, 4\}, \{4, 4\}\})
\]
\[
(C(malloc, 0, 4) \rightarrow [0x01020304, 0x01020304])
\]
\[
(C(malloc, 4, 4) \rightarrow (malloc, [8, 8]),
    p \rightarrow (malloc, [0, 0]),
    q \rightarrow (malloc, [4, 4]))
\]
\[
(C(malloc, 4, 4) \rightarrow NonNull, p \rightarrow NonNull, q \rightarrow NonNull)
\]
\[
(C(malloc, 0, 4) \rightarrow Init, C(malloc, 4, 4) \rightarrow Init, p \rightarrow Init, q \rightarrow Init))
\]
static union {
    struct { uint8 al, ah, bl, bh, ... } b;
    struct { uint16 ax, bx, ... } w;
} regs;
regs.w.ax = X; // (1)
if (!regs.b.ah) { // (2)
    regs.b.bl = regs.b.al; // (3)
} else { // (4)
    regs.b.bh = regs.b.al; // (5)
}
// (6)
regs.b.al = X; // (7)
Memory analysis - Memory abstract domain

(2) 

(3) 

(4) 

(5) 

(6) 

(7)
Last step: check for properties at each statement location

Checkers:

- buffer overflow: \( 0 \leq \text{offset} \) and
  \( \text{offset} + \text{read\_size} \leq \text{buffer\_size} \)
- division by zero: \( \text{divisor} \neq 0 \)
- null dereference: \( p \neq \text{Null} \)
- uninitialized variable: \( v \neq \text{Uninit} \)
- prover: \( v \neq 0 \)

3. Analyses

4. Miscellaneous
   - Abstract domains implementation
   - Analyzing C++
   - Exception handling
   - Relational abstract domains
   - Function summarization
   - Integer overflow

5. Conclusion
Abstract domains implementation

- Separate domain ($V \rightarrow D$) are implemented with patricia trees
- Insertion and removal in $O(\log(n))$
- Merge in $O(n)$
- Transformation in $O(n)$
- Very cheap union!

![Patricia Tree Diagram]
Analyzing C++ is very tricky:

- Heavy chains of function calls because of templates
- The libc++ needs to be modeled
- Need to be precise on pointers for virtual method calls
- Handle exceptions
Analyzing C++ is very tricky:

__v_17 = invoke_Z_13__ikos_assertb(main_18)

bb_9:

bb_10:
landingpad(main_21)
__v_18 = 0
__v_18 = add(__v_18, 0)
main_22 = extract_elem(main_21, __v_18)
__v_19 = 0
__v_19 = add(__v_19, 8)
main_23 = extract_elem(main_21, __v_19)

bb_11:
main_25 = bitcast_ZTIPv
main_26 = call llvm.eh.typeid.for(main_25)
Exception handling

- $\mathbb{D}_{\text{exc}}^# = \mathbb{D}^# \times \mathbb{D}^#$
- $\llbracket \text{throw}(e) \rrbracket^#(N, E) = (\bot, N \cup E)$
- $\llbracket \text{landingpad}(e) \rrbracket^#(N, E) = (E, \bot)$
- $\llbracket v = x \rrbracket^#(N, E) = (\llbracket v = x \rrbracket^#(N), E)$
- $(N_1, E_1) \sqcup^# (N_2, E_2) = (N_1 \cup N_2, E_1 \cup E_2)$
Intervals are very imprecise for loops with a non-deterministic bound.

Solution: use a weakly-relational domain, such as the DBM domain.

Difference-Bound Matrices

Weakly-relational abstract domain

\[
\begin{bmatrix}
0 & m_{0,1} & m_{0,2} & \ldots & m_{0,n} \\
m_{1,0} & 0 & m_{1,2} & \ldots & m_{1,n} \\
m_{2,0} & m_{2,1} & 0 & \ldots & m_{2,n} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
m_{n,0} & m_{n,1} & m_{n,2} & \ldots & 0
\end{bmatrix}
\]

- \( m_{i,j} \in \mathbb{Z} \cup \{+\infty\} \)
- \( v_i - v_j \leq m_{j,i} \)
- \( v_0 = 0 \), thus \( v_i \in \left[-m_{i,0}, m_{0,i}\right] \)
- Abstract operations require normalization
  - normalization: 
    - \( v_i - v_k \leq m_{k,i} \) and 
    - \( v_k - v_j \leq m_{j,k} \) \( \Rightarrow \)  
    - \( v_i - v_j \leq m_{k,i} + m_{j,k} \)
- cost \( O(n^3) \), \( n \) number of variables
Idea: keep a list of DBMs, where each DBM contains variables that are related to each other.

Union-Find structure to dynamically infer relations among variables.

Normalization cost $O(n)$, $n$ number of DBMs.

Other ideas

- Group variables depending on heuristics
- Use the gauge domain
Other ideas

- Group variables depending on heuristics
- Use the gauge domain

Work in progress!
IKOS uses dynamic inlining

Idea: analyse each function only once to build a summary
**Problem**: call graph cycle

```
main
  ^  
  |  
  v  
  f   g

  ^  
  |  
  v  
  h   w
```
Problem: call graph cycle

- Strongly connected component analysis
- Topological order
- Bottom-up analysis (from the leaves to the root)
- Top-down analysis (from the root to the leaves)
Function summarization: Memory analysis

- Need a way to express the effect of a function call on the memory
- More particularly on global variables and pointer parameters
- Relation between the input memory state and the output memory state
- Idea: Introduce *input cells* and *output cells*

\[ x = x + 1 \Leftrightarrow Cell\{x, 0, 4, Out\} = Cell\{x, 0, 4, In\} + 1 \]
Buffer overflow analysis using function summarization

</table>
Problem: LLVM integer types are signedness agnostic.

Because most instructions are signedness agnostic: add, sub, mul, etc.

How to be sound and precise?

- Intervals with infinite precision: imprecise or unsound
- Suppose integers are unsigned: imprecise
- Suppose integers are signed: imprecise
- Wrapped intervals: Jorge Navas’s paper « Signedness-Agnostic Program Analysis: Precise Integer Bounds for Low-Level Code »
- Domain product: unsigned and signed
