NASA Ames Research Center
Air Traffic Management Research Overview
Sandy Lozito
Chief, Aviation Systems Division
July 18, 2017
• Who’s ever been delayed at the airport waiting to depart for what appears to be no reason whatsoever?
• Who’s ever landed and had to wait for a gate for 20+ minutes?
• Who’s ever wanted to fly their sweet new UAV over their massive oil pipeline without slamming into all sorts of other UAVs?
Why is aviation so important?

The air transportation system is critical to U.S. economic vitality.

- **$1.5 TRILLION**
  - TOTAL U.S. ECONOMIC ACTIVITY
  - (civil aviation-related goods and services, 2012)

- **$76.1 BILLION**
  - POSITIVE TRADE BALANCE
  - (aerospace industry, 2012)

- **11.5 MILLION**
  - DIRECT AND INDIRECT JOBS
  - (civil and general aviation, 2012)

- **5.4%**
  - OF TOTAL U.S. GROSS DOMESTIC PRODUCT (GDP)
  - ($847.1 BILLION)
  - (civil and general aviation, 2012)
Why should I care?
Take the system view. You may not have flown today but something you needed did.

17.7 Billion
TONS OF FREIGHT TRANSPORTED BY AIR
(all U.S. carriers, 2013)

$670.8 Billion
SPENT BY AIR TRAVELERS IN U.S. ECONOMY
(domestic and foreign travelers, 2012)

741 Million
PASSENGERS ON U.S. CARRIERS
(domestic and foreign, 2013)
What are the challenges?

Challenges are driven by emerging global trends.

- **16 BILLION**
  - Gallons of jet fuel burned in 2013 (U.S. airlines)

- **$8.1 BILLION**
  - Cost of delays to U.S. airlines in 2013

- **$9.3 BILLION**
  - Spent by airports on noise abatement since 1982

- **3%**
  - Of global CO₂

- **5%**
  - Warming effects projected from aviation by 2050

- **360 MILLION**
  - Passengers being added in Asia Pacific from 2009 to 2014
    (market is growing and moving East)
Why is "Aeronautics" the first "A" in NASA?

The nation’s early aeronautics research led to creation of NASA.

National Advisory Committee for Aeronautics
March 3, 1915

National Aeronautics and Space Administration
October 1, 1958

7,500 NACA employees
$300 million in NACA research facilities
(Langley, Lewis Field, Ames)
NACA research process
What does NASA Aeronautics do?

NASA is with you when you fly.
What vision has NASA set for aviation?

A revolution in sustainable global air mobility.
Who is NASA Aeronautics?

Engineers, pilots, managers, programmers -- we are proud of our legacy of technology contributions to aviation.
What is NASA Aeronautics working on?

Research activities reflect NASA’s vision to ultimately transform aviation.

- Air traffic management tools that reduce delays and save fuel
- Aircraft shapes that reduce aviation’s impact on the environment
- Data that reveals the real impacts of alternative jet fuels
- Tests of new technologies that increase autonomy in the aviation system
- Technologies that lower the volume on sonic booms
- Ground tests on ways to detect and prevent engine icing in jet engines
Test your knowledge!

• NASA is a:
  A. Privately-owned company
  B. Federal government agency
  C. Part of the Department of Defense
  D. Federally-funded research and development corporation (FFRDC)
  E. A non-profit organization
Test your knowledge!

• NASA is a:
  A. Privately-owned company
  B. Federal government agency
  C. Part of the Department of Defense
  D. Federally-funded research and development corporation (FFRDC)
  E. A non-profit organization
Test your knowledge!

• How many NASA field centers are there, not including HQ?
  A. Three
  B. Four
  C. Five
  D. Seven
  E. Ten
Test your knowledge!

• How many NASA field centers are there, not including HQ?
  A. Three
  B. Four
  C. Five
  D. Seven
  E. Ten; how many can you name?
Where does NASA aeronautics research happen?

Aeronautics research takes place at four of NASA’s centers.

- Ames
- Armstrong
- JPL
- Langley
- Glenn
- Goddard
- HQ
- Kennedy
- Johnson
- Stennis
- Marshall

AMES

N200

* National Advisory Committee on Aeronautics (predecessor to NASA)
USS Macon

February 1934
First Ames Test Plane – O-47A

October 1940
Aerial View of Ames Research Center
Ames Contributions

Has conducted pioneering aeronautics research since WWII

Designed and developed the Pioneer spacecraft, including Pioneer 10, the first spacecraft to encounter Jupiter and the first spacecraft to leave the solar system (1983)

Designed the heat shield for the Stardust comet sample return mission
Home to the Pleiades supercomputer, one of the fastest in the world
Leads the Kepler mission to detect Earth-like planets in other solar systems.

Led the LCROSS mission that has discovered water on the moon.

Made major contributions to heat shield development, parachute testing, and scientific instruments aboard the Mars Science Laboratory (Curiosity).
Four NASA Mission Directorates

- Aeronautics Research Mission Directorate (ARMD)  
  *Dr. Jaiwon Shin*

- Human Exploration and Operations Mission Directorate (HEOMD)  
  *William Gerstenmaier*

- Science Mission Directorate (SMD)  
  *Dr. John Grunsfeld*

- Space Technology Mission Directorate (STMD)  
  *Dr. Michael Gazarik*
NASA Aeronautics Research

We have aligned our research efforts with these six research thrusts.

### 3 Mega-Drivers

#### Safe, Efficient Growth in Global Operations
- Enable full NextGen and develop technologies to substantially reduce aircraft safety risks

#### Innovation in Commercial Supersonic Aircraft
- Achieve a low-boom standard

#### Ultra-Efficient Commercial Vehicles
- Pioneer technologies for big leaps in efficiency and environmental performance

#### Transition to Low-Carbon Propulsion
- Characterize drop-in alternative fuels and pioneer low-carbon propulsion technology

#### Real-Time System-Wide Safety Assurance
- Develop an integrated prototype of a real-time safety monitoring and assurance system

#### Assured Autonomy for Aviation Transformation
- Develop high impact aviation autonomy applications
## NASA’s Aeronautics Programs

Our Core Abilities

• ATM Research
  – *Airspace domains* – en route, terminal area, surface, nation-wide, regional
  – *Engineering skills* – airspace operations and procedures, optimization, scheduling, trajectory prediction and analysis, data mining, learning algorithms, human factors and automation, software development, computer and systems engineering

• Flight Simulation
  – Operating world-class, high fidelity flight simulators
  – Developing flight simulation scenarios, math models, etc.
Challenges We Confront

• The air transportation system of the future will need to accommodate a higher demand of commercial air traffic as well as manage a complex mixture of flying vehicles, and meet requirements for maintained safety as well as reduce environmental impact.

• Future commercial air transportation is likely to be comprised of not only the legacy aircraft seen today, but will have to operate alongside more advanced, capable aircraft, and all sizes of unmanned aerial systems (UAS) all vying for the same airspace access.

• The operators of the system increasingly rely on technology advances to make the overall system run more efficiently without compromising safety.
What is the focus of the Aviation Systems Division?

- Air Traffic Management
- Unmanned Aerial Systems/UAS Traffic Management
- Vertical Motion Simulator
- High Fidelity Flight and Airspace Simulation
- FutureFlight Central
- Boeing 747 Simulator
National Airspace System

The network of United States airspace: air navigation facilities, equipment, services, airports or landing areas, aeronautical charts, information/services, rules, regulations, procedures, technical information, manpower, and material.

- 280,000+ aircraft
- 19,854 airports
- 16,000 air traffic controllers
- Etc…
Air Traffic Control System Command Center
Air Route Traffic Control Centers
Jacksonville Sectors

Vertical Motion Simulator

FutureFlight Central

Air Traffic Management Simulation
North Texas Research Station

**Dallas/Fort Worth International**

- 679,820 flights in 2014
- 3rd among US airports (per ASPM/ATADS)

**Southwest Airlines**

- More than 1.1M flights in 2014
- 2nd among US air carriers (per BTS)

**American Airlines**

- More than 1.1M flights in 2014
- 1st among US air carriers (per BTS includes USAir)

**Dallas Love Field**

- 182,949 flights in 2014
- 41st among US airports (per ASPM/ATADS)

**North Texas Research Station**

- NASA research assets embedded in a high-demand, varied operational air transport environment
- Access to ARTCC, TRACON, Towers, 3 air carrier AOCs (American, Envoy and Southwest), and 2 major airports all within 12 miles.
- Supports NASA NextGen research activities from concept development through operational field evaluation.

**NTX Laboratory**

- 5000 ft² purpose-built, dedicated, air traffic management research facility
- Re-configurable computer labs, dedicated radio tower, established data links to local operational facilities and NASA centers.
- Research engineers experienced in air traffic operations analysis, technology development, and field evaluations

**PARTNERSHIPS**

Last updated 1/7/16
Taking NASA Technology to the Flying Public

• NASA is planning a series of “tech demos” of evolving air traffic management technologies
  – Integrated concepts where appropriate
  – Leveraging some of the most advanced infrastructure (e.g., ADS-B, RNAV/RNP precision routing, etc…)
  – “Live” air traffic evaluations, beginning in 2014
  – New technology “suites” tested every two years

• Transfer of technologies to the FAA and industry once concepts are validated in live traffic tests
ATM Technology Demonstration 1 (ATD-1)

ATD-1 is an integrated set of NextGen technologies that provides an efficient arrival solution.
Time-Based Flow Management (TBFM)

- Generates conflict-free arrival scheduling based on airport conditions, airport capacity, and required spacing.
- Involves metering of terminal area traffic flows to avoid downstream congestion.

Uses speed adjustments instead of vectoring to precisely maintain aircraft spacing through:

- Controller Managed Spacing (CMS) decision support tools on controller displays.
- Flight Deck Management (FIM) guidance capabilities to pilots using ADS-B (automatic dependent surveillance – broadcast) information.
NAS Delays Due to Weather

- 24-hr delay video
- This animation shows a typical day of air traffic in the national airspace system during convective weather and the scope of the air traffic delay problem. The dots represent actual flights. The gray flights are on time. The flights with blue streaks are delayed between 15 minutes to 2 hours. The flights with red streaks are delayed 2 hours or more.
Airspace Technology Demonstration 2 (ATD-2)
Data exchange and airport/airspace integration

- Collaborative decision making enabled by new data exchange among ATC, flight operators, and airports
- On-ramp to the overhead stream via FAA’s Time Based Flow Management system

Surface modeling, scheduling, and metering

- Combines pushback estimates from flight operators with trajectory-based airport operations model to provide accurate capacity estimates
- Implements FAA’s Surface Collaborative Decision Making concept for surface metering
Airspace Technology Demonstration 3 (ATD-3)

Current Weather Avoidance Playbook Route

ATD-3 Suggested Reroute

~90 min to MF

~60 min to MF

Efficient arrival reroutes to maintain time-based metering

Freeze Horizon (20 min to MF)

En Route Airspace

Flight-deck based automated searches for efficient reroutes during flight

Ground-based automated searches for efficient individual flight and common multiple flight reroutes - delay recovery from stale TMI

Integrate ground-based and flight-deck technologies, leveraging NextGen capabilities, to maximize benefits of dynamic reroutes

Terminal Airspace

Ground Station (AOC or ANSP)
NASA is developing and plans to demonstrate technologies and procedures to identify strategic, user-preferred routes and enable tactical route corrections in domestic en route and arrival airspace to:

- Reduce the impact of unpredictable weather
- Enable continuous searching for more efficient routes for individual flights and groups of flights
- Efficiently share route correction options between traffic managers, controllers, pilots, and dispatchers
UAS in the NAS

• Conducted a series of experiments to measure the time to transmit aircraft state data, involving NASA Ames, Dryden, and Glenn

• Developed and delivered algorithms that provide the UAS’s sense-and-avoid capabilities

• Collected more data on defining the airborne separation standard “well clear” and when to notify the pilot of potential collision situations.
NASA is helping establish infrastructure to enable and safely manage the widespread use of low-altitude airspace and UAS operations.
Where do we see NASA’s benefits today?

NASA's fundamental research can be traced to ongoing innovation.

**Efficient Descent Advisor**

NASA's work on these technologies:
- Human-in-the-loop simulations
- Joint flight trials with FAA and airlines
- Automated decision support tools
  - Traffic Management Advisor
  - 3-Dimensional Path Arrival Management
- Trajectory and arrival modeling and solutions

Was transferred for use here

Benefits:
- Fuel-efficient continuous descents
- Potential $300 million jet fuel savings per year (savings vary per spot fuel costs)
- Reduced delays in congested airspace
- Reduced noise and emissions around airports
- Retained safety
- Reduced controller workload through increased automation

**Federal Aviation Administration**

Source: FAA

**Precision Departure and Release Capability**

NASA's work on these technologies:
- Human-in-the-loop simulations
- Operational field trials
- Automated decision support tools

Was transferred for use here

Benefits:
- Improved precision in departure times even in bad weather and heavy traffic
- Reduced number of "missed" slots in overhead aircraft traffic stream
- More than 50% improvement in number of flights departing within release window
- Reduced congestion system-wide

**Federal Aviation Administration**

Source: FAA

Transferred to FAA in August 2013 for further development and implementation.

**Terminal Sequencing and Spacing**

NASA’s work on these technologies:
- Human-in-the-loop simulations
- Operational field trials
- Automated decision support tools

Was transferred for use here

Benefits:
- Improved controller ability to coordinate flight paths of descending aircraft in congested airspace
- Increased capacity for aircraft in same amount of airspace
- Improved traffic flow

**Federal Aviation Administration**

Source: FAA

Transferred to FAA in February 2014 for further development and implementation.
Where do we see NASA’s benefits today?

NASA's fundamental research can be traced to ongoing innovation.

Traffic and Atmospheric Information for General Aviation

NASA's work on these technologies
- Human-in-the-loop simulations
- Operational field trials
- Automated decision support tools

Was transferred for use here

Transferred to the State of Alaska’s Department of Transportation in 2014 for implementation.

State of Alaska’s DOT
Source: Alaska DOT

Benefits
- Improved situation awareness to general aviation and air taxi pilots
- Better access to data and better interaction with that data on a modern, off-the-shelf mobile device

Last updated 10/26/15
How do NASA and the FAA work together?

Our roles are different but our goals to improve efficiency and safety are the same.

<table>
