Limb Correction and Adjustments Applied to Imagery Derived from Differing Sensors to Improve Comparison of RGBs

NASA Short-term Prediction Research and Transition Center (SPoRT) Marshall Space Flight Center; Huntsville, Alabama, United States of America

Gary Jedlovec, Emily Berndt, Nicholas Elmer, Kevin Fuell, Kevin McGrath

RGB Experts and Developers Workshop - November 2017 Tokyo, Japan
Introduction/Motivation

- Limb effects can interfere with qualitative interpretation at high viewing angles
  - Limits use of polar-orbiting swaths
  - Can lead to misinterpretation of features (i.e. Tropical Air appears blue not green in the Air Mass RGB)

**Advantages of Limb-Corrected RGBs**

- Improved forecaster situational awareness
- Increased confidence in interpretation of RGB features
- More accurate representation of atmosphere and surface on the limb
- Ability to utilize the full satellite image, rather than just part of the image close to nadir
- Improved transition between overlaid RGB composites

![Uncorrected SEVIRI](image3)
![Limb-corrected SEVIRI](image4)
Introduction/Motivation

• Comparing RGBs across different sensors can be problematic
  • Differences in spectral characteristics of band (i.e. central wavelength, spectral bandwidth, spectral response function)
  • Differences in absorption characteristics (i.e. SEVIRI 3.9 µm band influenced by CO₂ absorption)
  • These differences can lead to inconsistent coloring and impact interpretation
Limb Correction

• Elmer et al. (2016) developed limb correction technique to remove limb effects from Terra/Aqua MODIS and Suomi-NPP VIIRS infrared channels in real-time
  • Valid in both clear and cloudy regions
  • Function of latitude, Julian day, SZA, and cloud top pressure (for cloudy regions only)
  • Correction applied to all RGBs using longwave infrared bands

2012 October 27 Terra (0305 UTC) and Aqua (0725 UTC) MODIS Air Mass RGBs (original and corrected) showing a developing Hurricane Sandy.
Limb Correction

Uncorrected VIIRS and SEVIRI

Limb-corrected VIIRS and SEVIRI*

1245 UTC 3 September 2015 VIIRS and SEVIRI Dust RGB

*Cloud effects not accounted for in SEVIRI imagery
Technical Approach

- Brightness temperatures \( T_B \) simulated at varying satellite zenith angles using JCSDA Community Radiative Transfer Model (CRTM)

- Cloud-free atmospheric profiles of temperature, water vapor, and ozone obtained from global annual subset of ECMWF profiles used as input to CRTM

- The change in \( T_B \) from nadir to the limb \( (T_{B\text{NADIR}} - T_{B\text{LIMB}}) \) and the natural log of the cosine of the satellite zenith angle \( (\theta) \) are related by a quadratic function:
  \[
  y = C_2x^2 + C_1x
  \]

- Least-square fit parameters, \( C_1 \) and \( C_2 \), are defined as the limb correction coefficients

- Changing \( C_1 \) and \( C_2 \) by a value of 1 corresponds to change in \( T_{B\text{LIMB}} \) of 0.7 K and 0.5 K, respectively, at \( \theta = 60^\circ \)

- The limb-corrected \( T_B \) \( (T_{\text{corr}}) \) can be calculated from the uncorrected \( T_B \) \( (T_{\text{raw}}) \) given \( \theta \):
  \[
  T_{\text{corr}} = T_{\text{raw}} - C_1 \ln(\cos \theta) - C_2 \ln(\cos \theta)^2
  \]

- Correction coefficients vary latitudinally and seasonally!
Limb Correction in Clear Regions

Limb-cooling in MODIS band 27 (6.7 μm) for midlatitudes (45°-60°)

$T_{θ_Z} - T_0 = C_2 |\ln(\cos θ_Z)|^2 + C_1 |\ln(\cos θ_Z)|$

- Least-square fit parameters, $C_1$ and $C_2$, are defined as the limb correction coefficients
- Correction coefficients vary latitudinally and seasonally (Joyce et al. 2001; Elmer et al. 2015, 2016)
Limb Correction in Cloudy Regions

- Layer optical thickness ($\tau_l$) calculated from JCSDA Community Radiative Transfer Model (CRTM; Han et al. 2006)
- Cloud correction coefficient ($Q$) calculated from $\tau_l$:
  \[
  t_l(p) = e^{-\tau_l(p)}
  \]
  \[
  t(p) = t_l(p) \cdot t(p - 1)
  \]
  \[
  Q(p) = \frac{t(0) - t(p)}{t(0) - t_p}
  \]
- $Q$ varies latitudinally and seasonally, similar to limb correction coefficients $C_1$ and $C_2$, $Q = 1$ in clear regions
- Limb Correction Equation:
  \[
  T_{CORR} = T_B + Q \left[ C_2 \ln(\cos\theta_Z)^2 - C_1 \ln(\cos\theta_Z) \right]
  \]
- Applicable to polar-orbiting and geostationary sensors

Cloud correction coefficient (annual global mean) (Elmer et al. 2016)
Technical Approach: Geo Limb Correction

- Extend Elmer et al. (2016) limb correction technique to MSG SEVIRI
  - MSG Optimal Cloud Analysis (OCA; EUMETSAT 2016) provides cloud top pressure for SEVIRI for SZA < 75°
  - Limb-corrected Aqua MODIS used to validate SEVIRI limb correction
  - MODIS and inter-calibrated with SEVIRI prior to limb correction to account for sensor differences, following methodology in Elmer et al. (2016)
Limb Correction: Air Mass RGB

(considering cloud effects)
Adjusting RGB Recipes

• Directly applying EUMETSAT recipes to sensors with different spectral and absorption characteristics can lead to color differences in the RGB imagery and impact interpretation.

• For example the EUMETSAT best practices recommend adjusting the RGB recipe when creating RGBs with instruments such as the Moderate Resolution Imaging Spectroradiometer (MODIS) due to differing spectral and absorption characteristics across sensors.

• JMA has pioneered work to adjust EUMETSAT recipes for advanced sensors such as AHI.

• This work extends JMA’s approach to apply recipe adjustments to GOES-16 and –S and match RGBs derived from non-overlapping sensors.
Night-Time Microphysics RGB

• AHI RGB coloring and component intensities differ from the SEVIRI proxy overlay

Low cloud/Fog not aqua as expected
Lack of R intensity
Lack of G intensity
B intensity similar

Differences in H$_2$O$_v$ absorption of longwave bands?
Differences in CO$_2$ absorption of 3.9 bands?
### Recipe Adjustment

#### Adjustment by SEVIRI Proxy

Adjusted Night-time Microphysics

- With the new adjustment RGB colors and component intensity are similar to the SEVIRI proxy overlay (SEVIRI overlay barely visible!)
- Adjustment improves the lack of red and green intensities noted earlier
- RGB colors are consistent with legacy interpretation and training
Adjusted Night-time Microphysics

• The adjustment improves the aqua coloring of the low cloud/fog features
• Since the adjustment is similar to the JMA derivation for AHI, this research verifies work done by JMA and demonstrates a computationally inexpensive methodology to determine recipe adjustments for RGB imagery derived with GOES-R and GOES-S in the future
• Slight color differences between case study and JMA adjustments attributed to the ability to account for instrument bias, noise, and full atmospheric absorption when using real data
