October 28, 2017
Cryogenic Fluid Management of propellant storage tanks is in the critical path of most envisioned NASA exploration mission including mission to Mars.

The Zero Boil Off Tank (ZBOT) experiment provides a small-scale simulants-fluid investigation of storage tank pressurization and pressure control in the Microgravity Science Glovebox (MSG) unit aboard the ISS. Its objectives are to:

- Elucidate the roles of the various interacting transport and phase change phenomena that impact tank pressurization and pressure control in microgravity to form a scientific foundation for storage tank engineering.
- Obtain microgravity data for tank stratification, pressurization, mixing, destratification, and pressure control time constants during storage.
- Develop a state-of-the-art CFD two-phase model for storage tank pressurization & pressure control.
- Validate and Verify the zonal- and CFD-based tank models using the microgravity data. Use the model and correlations to optimize and scale-up future storage tank design.
Validation Cases That Have Been Performed

- Natural Convection
- Forced Mixing
- Evaporation/Condensation
- Microg Superheats/Nucleate Boiling
- Droplet Breakup & Transport
- Droplet Phase Change
- Microgravity Two-Phase Flow & Heat Transfer Regimes/Transitions
- Interfacial Turbulence Effects
- Vapor-Side Turbulent Transport
- Non-Condensable Gas Transport
- Double Diffusive Barriers
- Marangoni Convection
- Interfacial Mass Transfer Kinetics
- Capillary Flow & Free Surface Dynamics
- Contact Angle Dynamics & Thin Film Evaporation
- Sloshing
- Phase Control/Positioning

Notional Pathway to Mature Understanding Of CFM Fluid Physics and Validated Computational Models

- 1-g Data
- \(\mu g\)-Fundamentals (Simulant Fluids)
- \(\mu g\)-Subscale Experiments (Cryogens)

Experimentation

- K-Site, MHTB
- ZBOT, TPCE
- RMM3, Other Notional ISS JEM Cryo Experiments

Modeling/Analysis

- Multinode Models: GFSSP, Sinda/Fluint
- CFD Models: Ansys/Fluent, Flow3D

Cryo Demonstrations

SOA Models
Experiment was installed by Astronaut Joe Acaba on September 19 & 20th in the MSG and powered up.

System thermal & fluid characterization started on September 24th

Actual Test runs began on Oct 1st

Currently the 70% test runs are being conducted and near completion

Data and images are being downloaded continuously

Stainless Steel Test Tank Base, Nozzle & Screen LAD
ZBOT Camera & Illumination Package for Image Capture & PIV

- **Camera Acceptance Cone**
- **Beam Dump**
- **Tank**
- **Diode Laser**
- **Light Sheet Tilted 12°; eliminate tilt for ZBOT-2**

Diagram showing the components and layout of the ZBOT Camera & Illumination Package.
ZBOT Tank Pressurization & Mixing Cooling Test Matrix

- 68 pressurization, jet mixing, and destratification tests will be performed first at 3 fill levels with and without Particle Imaging Velocimetry (PIV)
- 30 Tests will be repeated with particles injected & PIV performed as Tech Validation

### Input Variables (Tolerances)

<table>

### Perfluoro-n-Pentane
(PnP, or C5F12) n-isomer (Straight Chained) Chemical Structure

- Refrigerant/Cleaning fluid
- High purity (99.7% straight-chained n-isomer)
- Boiling Point = 29°C @ 1 atm
- Vapor Pressure = 12.5 psia @ 25°C

**Benefits**
- Boils Near Room Temperature
- Near zero contact angle with test tank
- Tox 0 – Approved by JSC toxicology and MSFC ECLSS groups as safe for use within International Space Station
Ground Based Model Validation Experiment in Flight Hardware: 1G Self-Pressurization - Vacuum Jacket Heating

VJ Heating (3.75 W/m²), 70%, Self-Pressurization: { $Ra_L \Rightarrow (10)^{11}$, $Ra_V \Rightarrow (10)^8$ }
Ground Based Model Validation Experiment in Flight Hardware: 1G Self-Pressurization – Strip Band Heating

Strip Band Heating (1W), 90%, Self-Pressurization: \{ \text{Ra}_{L} \rightarrow (10)^{11}, \text{Ra}_{V} \rightarrow (10)^{8} \}
Validation Against ZBOT-Flight 1G Pressurization – Energy Flow & Distributions During SB Heating & VJ Heating

**SB Heating Self-Pressurization**

\[ Q_{IL} > Q_{IV} \]
\[ \dot{m} > 0 \]

Evaporation

\[ \dot{m}L = Q_{IL} - Q_{IV} \]

**VJ Heating Self-Pressurization**

\[ Q_{IL} < Q_{IV} \]
\[ \dot{m} > 0 \]

Evaporation

\[ \dot{m}L = Q_{IL} - Q_{IV} \]

Development & Validation of Analysis Tools (DVAT) For CFM

Develop a computational platform to study and simulate the engineering performance of propellant storage tanks in 1g and microgravity with physical and numerical fidelity:

- **Multiphase CFD Models**: Capture the intricate two phase transport and interfacial phenomena that control tank pressurization, pressure control, filling, and cryogen transfer in 1g, partial g and microgravity with physical accuracy.

- **Multinode Models**: Be able to predict tank engineering performance with numerical efficiency.

- **Coupled CFD-Multinode simulations** necessary to predict tank performance during long duration (up to 1 year) missions.

- **Increase capabilities** of both CFD and multi-node analysis tools to perform predictive simulations of different Cryogenic Fluid Management (CFM) operations under settled and unsettled conditions for future missions:
  - Self-Pressurization
  - Pressure control (axial jet, spray bar TVS, Broad Area Cooling)
  - Pressurization (helium and autogenous, different submergence)
  - Transfer line chilldown (pulse, continuous)
  - Tank chilldown (charge-hold-vent)
  - Tank filling and draining
  - ISRU liquification

**Continuity:**
\[
\frac{\partial \rho}{\partial t} + \nabla (\rho \vec{v}) = 0
\]

**Momentum:**
\[
\frac{\partial}{\partial t} (\rho \vec{v}) + \nabla (\rho \vec{v} \cdot \vec{v}) = -\nabla p + \nabla \left[ \mu_{eff} \left( \nabla \vec{v} + \nabla \vec{v}^T \right) \right] + \rho \vec{g} + \vec{F}_{vol}
\]

**Energy:**
\[
\frac{\partial}{\partial t} (\rho E) + \nabla (\rho E + p) = \nabla \left( k_{eff} \nabla T \right) + S_h
\]

**Species:**
\[
\frac{\partial}{\partial t} (\rho \omega) + \nabla (\vec{v} \cdot (\rho \omega)) = \nabla \cdot (\rho D_m \nabla \omega)
\]

**Interfacial Energy Balance:**
\[
P_v = \frac{\omega_v M_g}{\omega_v M_g + (1 - \omega_v) M_v} P
\]

**Schrage Interfacial Mass Transfer:**
\[
L J_v = -k_i \vec{v} \cdot \hat{n} + k_i \vec{v} \cdot \vec{T} \cdot \hat{n}
\]

**Stefan Wind:**
\[
J_v = -\left( \frac{\rho D_m}{1 - \omega_v} \right) \nabla \omega \cdot \hat{n}
\]
Two-Phase VOF Interface Storage Tank CFD Model

Energy and Temperature as mass average scalars:

\[ E = \frac{\sum_{q=1}^{2} \alpha_q \rho_q E_q}{\sum_{q=1}^{2} \alpha_q \rho_q} \]

Properties:

\[ \rho = \sum_{q=1}^{2} \alpha_q \rho_q, \quad \mu_{eff} = \sum_{q=1}^{2} \alpha_q \mu_{eff\_q}, \quad k_{eff} = \sum_{q=1}^{2} \alpha_q k_{eff\_q} \]

Continuity of Volume Fraction of the \( q \)-th phase:

\[ \frac{1}{\rho_q} \left[ \frac{\partial}{\partial t} (\alpha_q \rho_q) + \nabla \cdot (\alpha_q \rho_q \vec{v}_q) \right] = S_{\alpha_q} \]

Continuum Surface Force (Brackbill et al.):

\[ F_{vol} = \sum_{\text{pairs } ij, i < j} \sigma_{ij} \alpha_i \rho_i h_i \nabla \alpha_j + \alpha_j \rho_j h_j \nabla \alpha_i \]

where \( h_i = \nabla \cdot \vec{n} \)

Interfacial mass transfer per unit volume:

\[ S_{\alpha_q} = \vec{m}_i \cdot A_i \left[ \frac{kg}{m^3 \cdot sec} \right] \]

\[ A_i = |\nabla \alpha|, \]

\( \vec{m}_i \) is a mass flux vector in kg/(m\(^2\)·sec)

Schrage Interfacial Mass Transfer:

\[ \vec{m}_i = J_v = \frac{2\sigma}{2 - \sigma} \frac{1}{\sqrt{2\pi RT_i}} [P_{sat}(T_i) - P_v] \]
