² KBRWyle, Moffett Field, CA
• Rodent Research Project’s goals:
  • Use of rodents as a translational model
  • To better understand long term adaptation to microgravity
  • To Maximize science return thru BioSpecimen Sharing
  • To expand science capabilities
Rodent Research Hardware

**Rodent Transporter**
- Houses mice during ascent and descent to/from ISS
- Accommodates up to 10 adult mice in each of the 2 compartments

**Rodent Habitat**
- Long-term housing on the ISS
- Accommodates up to 10 mice in one or separate compartments
- Continuous telemetry (%humidity, temperature)
- Video capability to monitor health and behavior

**Animal Access Unit**
- Attaches to Transporter and Habitat
- Used when accessing the animals for transfers, husbandry, or science procedures

**Mouse Transfer Box**
- Holds the animals during transfer to/from Transporter, Habitat, or MSG
- Holds animals in the MSG during science procedures
ISS Operations Overview

- Habitat
- Access Unit
- MSG
Rodent Research Capabilities

- **Husbandry**
  - Supply enrichment
  - Foodbar change out
  - Video health check
  - Group housing

- **Environmental Control**
  - Telemetry for temperature and %humidity
  - Light cycle
  - Real time alerts

- **DXA scanning with anesthesia & recovery**

- **Sample Recovery and Preservation:**
  - Euthanasia & Dissections
  - Cardiac puncture
  - Blood centrifugation
  - Tissue dissection and preservation
  - Fixative swap
  - Grip strength measurements
Capabilities: Video Health Checks

- Daily health checks
  - 1hr per habitat during dark cycle
- Extended video collection for behavioral studies
New Developments: Live Animal Return

- Transfer from Habitat to Transporter NET 36hrs before Dragon hatch close
- Dragon splashdown in Pacific Ocean
- Transporter/Locker transferred to SeaVan. Telemetry sensors installed.
- NASA delivers Transporter to PI designated lab (within 120 mi). Animals will be checked by PI, attending vet, and NASA science team
- NASA receives payload once SeaVan at Pier
- ~7hrs
- ~3-5hrs
- ~1hr
- ~48 hrs
New Developments: Enrichment Hut

- Enclosure for rodents to huddle and sleep in
- Supplied as a form of enrichment per animal welfare guidelines
- Made of stainless steel mesh, similar to the cage
- Facilitates animal retrieval by the crew
Working Microgravity is different than working in a lab on earth

- Investigators are used to processing large numbers of samples in a single day – with large teams, lots of space, no restrictions on time worked, etc.
- We work with Principal Investigators to develop an experiment flow that returns the best possible science results within the constraints for spaceflight research
  - Translates to full crew days and multiple days in a row
  - Time critical operations
- These requirements are captured in our Ground Rules and Constraints
Successfully completed 6 missions to date.
Rodent Research – 1 (SpaceX-4: Sep 21, 2014):

- Objective: Rodent Research Validation Mission

- 20 female C57BL/6J adult mice:
  - 10 (16 week old) for NASA’s validation mission
  - 10 (32 week old) for the National Lab’s science experiment

- Mission duration:
  - 33 days in microgravity (NASA’s Validation)
  - 18 days in microgravity (Novartis)

- Euthanized and dissections performed. Samples returned on SpX5 (Feb 2015)
- Crew times: 75 hrs

- BSP dissection:
  - First thaw: April 2015
  - Second thaw: March 2016
Rodent Research – 2 (SpaceX-6: April 14, 2015):

- Objective: Evaluate muscle atrophy in microgravity and identify molecular pathways and targets that could be used to develop novel therapies for muscle disease.

- PI: Samuel Cadena, Ph.D. (Novartis, CASIS sponsored)

- 20 female C57BL/6J adult mice:
  - 16 weeks old at launch

- Mission duration:
  - 50 days in microgravity

- On-orbit measurements:
  - Bone densitometry scan

- Euthanized and dissections performed. Samples returned on SpX-?
- Crew times: 157 hrs
Rodent Research – 3 (SpaceX-8: April 8, 2016):

- Objective: Evaluate effects of a drug (anti-myostatin) aimed at preventing muscle loss.

- PI: Rosamund Smith, Ph.D. (Elli Lilly, CASIS sponsored)

- 20 female BALB/c adult mice:
  - 12 weeks old at launch

- Mission duration:
  - 45 days in microgravity

- On-orbit measurements:
  - Bone densitometry scan
  - Grip assessment

- Euthanized and dissections performed. Samples returned on SpX-9

- Crew times: 125 hrs

- BSP dissection:
  - September 2016

• Objective: Characterize events associated with bone healing/tissue regeneration in a microgravity environment.

• PI: Rasha Hammamieh, Ph.D. (Dept. of Defense, sponsored by US Army Center for Environmental Health Research)

• 40 male C57BL/6 adult mice – *First Male Mouse Mission*
  o 10 weeks old at launch

• Mission duration:
  o 22 days in microgravity

• Pre-flight procedure:
  o Bone defect surgery
  o DXA scan

• Euthanized and dissections performed. Samples returned on SpX-10

• Crew times: 101 hrs

• BSP dissection:
  o May 2017
Rodent Research – 5 (SpaceX-11: June 3, 2017):

- **Objective:** Systemic Therapy of NELL1 for Spaceflight-Induced Osteoporosis

- **PI:** Chia Soo, Ph.D. (UCLA, CASIS sponsored)

- **40 female BALB/c adult mice** – *First Live Animal Return*
  - 32 weeks old at launch
  - 20 for Live Animal Return on SpX-11 (LAR)
  - 20 for ISS Terminal (IT)

- **Mission duration:**
  - 30 days in microgravity (LAR)
  - 60 days in microgravity (IT)

- **On-orbit Operations:**
  - Bone densitometry scan
  - IP injections

- **Euthanized and dissections performed (20). Samples returned on SpX-12**

- **Crew times:** 130 hrs

- **BSP dissection:**
  - August 2017
Rodent Research – 9 (SpaceX-12: Aug 14, 2017):

- PI: Michael Delp, Ph.D. (Florida State University, SLPS sponsored)

- 20 male C57BL/6 adult mice – *New Habitat Configuration*
  - 10 weeks old at launch

- Mission duration:
  - 35 days in microgravity

- Pre-flight measurement:
  - Gait assessment
  - Intraocular pressure

- All 20 mice returned live on SpX-12

- Crew times: 25 hrs

- BSP dissection:
  - Flight group: September 2017
  - Control group: March 2017
Rodent Research – 6 (SpaceX-13, NET Dec 4, 2017):

• Objective: To test the efficacy of sustained subcutaneous delivery of formoterol (FMT) released from nanochannel implants in the microgravity mouse model of muscle atrophy.

• PI: Alessandro Grattoni, Ph.D. (Houston Methodist, Novartis, CASIS sponsored)

• 40 male C57BL/6 adult mice:
  o 30-40 weeks old at launch
  o 20 for Live Animal Return on SpX-13 (LAR)
  o 20 for ISS Terminal (IT)

• Mission duration:
  o ~30 (LAR) or ~60 (ISS Terminal) days in microgravity

• Pre-flight procedure:
  o Nanochannel Delivery System (nDS) implants
  o Tail vein blood collection

• Euthanasia and dissections to be performed (20). Samples to be returned on SpX-14

• Crew times: ~145 hrs

• BSP dissection:
  o TBD
Summary

• Continuously expanding science capabilities, and refining sample collection and preservation methods
• Achieving both basic and translational research objectives.
• Maximizing science return through the Biospecimen Sharing Program (BSP), sponsored by NASA’s Space Biology Program
• Increased frequency of missions allowing for more science investigations
