Unmanned Aircraft Systems (UAS) Integration in the National Airspace System (NAS) Project

Terminal Operations HITL 1B
Primary Results
Presented to: RTCA SC-228 WG-1

27 March, 2018
Objective

• **Purpose:** leverage the lessons learned from the Foundational Terminal Operations human-in-the-loop (HITL) simulation to test a DAA system better suited to the terminal environment

• **Objectives:**
  – Implement two candidates for a terminal area DAA well clear (DWC) definition
  – Further investigate the efficacy of the DAA Corrective alert in the terminal area
  – Compare pilot and system performance to previous studies
Phase 1 DWC definition resulted in an exceedingly high number of alerts in the terminal area

- As a result pilots had a hard time judging when a maneuver was necessary to avoid high-severity LoDWC
  - 17 > 50% SLoWC & 6 > 70% SLoWC
  - No SLoWC above 30% in PT6

The DAA Corrective alert was shown to be less useful in the terminal area

- Best performance seen in configuration with DAA Warning but no Corrective
- Pilots rarely coordinated with tower before maneuvering against intruders
- Intruders often spent < 15sec as Corrective before transitioning to Warning

Encounters that occurred with ownship established on final were the most likely to lead to severe losses of DWC
Experimental Design

• 2 x 2 Mixed-Factorial Design
  – **DWC Candidate** (Within-Subjects):

</tbody>
</table>

**NOTES:**
- Corrective alert only present in *With Corrective* alerting configuration
- No sensor uncertainty was modeled
- Alerting criteria was identical between DWC Candidates
• Generic MQ-9 Reaper
  – Speed:
    • Cruise: 110 knots
    • Landing: 90-110 knots
    • Min: 70 knots
  – Default Climb/Descent Rate:
    • 1000ft/min
  – Roll:
    • Max: +/- 20°
    • Rate: 5°/sec
  – Pitch:
    • Max: +/- 10°
    • Rate: 1°/sec
Ground control station (GCS) contains:

1. **Viewer Tool** – contains approach plate & airport facility directory (AFD)
2. **Tactical Situation Display** (TSD) – DAA information and vehicle control interfaces
3. **Right Panel** – landing checklist and additional info
4. **Voice communication panel** – touchscreen, transmit/receive on select freqs.
• Primary = Rwy14
• Runway 14/32
  – Length = 6000ft x 150ft
  – RNAV (GPS)
• Elevation = 129ft
• Traffic Pattern = 1150ft
• Downwind offsets:
  – Left = ~1.5nm
  – Right = ~0.5nm
• Runway 20/02
  – Not used

Traffic Pattern Altitude = 1150ft
3NM (WP1) to RW14 (WP2) = 3nm
RW14 (WP2) to RW32 (WP3) = 1nm
Simulation Components

- Pseudo-pilots monitored and managed all manned traffic (IFR & VFR)
  - Multi-Aircraft Control System (MACS) software suite
- Air Traffic Control managed UAS and manned traffic
  - Tower controller managing Santa Rosa (KSTS)
  - Center controller managing Oakland Center (ZOA 40/41)
  - Sector traffic modeled using real sector activity and data
- All participants communicated via push-to-talk headsets
  - KSTS Tower frequency: 118.50
  - Oakland Center frequency: 127.80
  - KSTS ATIS: 120.55
Training on DAA System

• Pilots trained first on the ground control station followed by training on the DAA system
  – Trained on the meaning of each alert/guidance type in their given configuration
  – Practice en-route scenario flown with conflicts & ATC in-the-loop
• Pilots trained last on how to fly the given approach
  – 2 practice approaches flown, one with a scripted conflict
• Informed that a DAA system has been specifically developed to support terminal operations
  – Told the hazard zone was 1500ft x 450ft (did not explain tau component)

❖ Told to use the DAA system to maintain DAA well clear from traffic in the terminal environment (i.e., expected to utilize the alerts/guidance)
• Participants flew 2 types of approaches into Santa Rosa Rwy 14 under Instrument Flight Rules (IFR)
  – Instrument (RNAV GPS) Approach
  – “Visual” Approach

• Common across scenarios:
  – Start in Vigilant Spirit’s HOLDS mode & in Oakland center airspace
  – Coordinate transfer to KSTS Tower
  – Perform checklist actions as able (e.g., check ATIS, brief approach)
  – Fly final in Vigilant Spirit’s NAV mode (enables glide slope)
**Scenario Design**

**Instrument Approach Notes:**
- Final approach coarse offset 15°
- **Missed approach procedures** = climb to 5000ft, fly runway heading (143°)

**“Visual” Approach Notes:**
- Airport “in sight” 10-12nm from runway
- Line up for 3nm final stabilized approach
- Traffic pattern @ 1150ft
- **Go-around** = climb to pattern alt (1150ft)
• Pilots flew 4 trials per day (2 Instrument & 2 Visual)
• 4 approaches flown per trial (= ~45min per trial)
• The following encounter types occurred every trial:
  • **Turn Into** = traffic blunders into UA on final and will result in NMAC without UAS pilot response [1 per trial]
  • **Turn In Front** = traffic turns in front of UAS with sufficient separation (~1.5-2nm) to land safely (the turn is coordinated w/ Tower) [1 per trial]
  • **Unscripted** = no encounter is scripted to occur but traffic expected to be on downwind as UAS is on final [2 per trial]

• Encounter type breakdown:

<table>
<thead>
<tr>

<tr>
<td>Unscripted</td>
<td>No</td>
<td>N/A</td>
<td>No</td>
</tr>
</tbody>
</table>
Participants

- 16 UAS pilot participants (avg. age = 33 years)
  - All IFR rated with manned & unmanned flying experience
    - **Manned experience** = avg. 1000 civilian flight hours, 1600 military flight hours
    - **Unmanned experience** = avg. 500 civilian flight hours, 700 military flight hours
- 2 retired tower controllers served as tower controller confederates
- 1 ATC SME served as center controller confederate
- 4 current general aviation pilots served as manned traffic confederates
RESULTS
DAA ALERTING AND MEASURED RESPONSE
• 32 total alerts desired per DWC candidate
  
  \[= 16 \text{ [pilots]} \times 2 \text{ [trials per pilot]} \times 1 \text{ [Turn Into encounter per trial]}\]
  
  • There was also 1 Turn In Front encounter per trial

• 215 different intruders registered (in truth) as a DAA alert
  
  – “Truth” alerts = all alerts captured by the DAA system, across all trials and conditions (ignores alert configuration variable)

• The Tau DWC candidate alerted more frequently overall, a consequence of disproportionately alerting to Unscripted traffic
More Corrective (truth) alerts issued when Tau DWC definition used
- No Tau = 42 total
- Tau = 75 total

Majority of these Corrective alerts lasted less than 6sec
- NOTE: 4sec is min. alert duration
- Most did not progress to a Warning alert
  - No Tau = 17/22 (77%)
  - Tau = 44/53 (83%)

Avg. Corrective alert duration
- No Tau = 6.9sec
  - Median = 5sec
- Tau = 7.5sec
  - Median = 5sec
- Typically allot 10-15sec for ATC coordination
Corrective (truth) alerts least common during the Turn Into encounter types
  – Only 13 Corrective alerts issued against Turn Into encounters

Correctives more common with Turn In Front & Unscripted encounters
  – Turn In Front = 30
  – Unscripted = 74

Avg. Corrective duration
  – Turn Into = 10.8sec
    • Median = 9sec
  – Turn In Front = 9.6sec
    • Median = 5sec
  – Unscripted = 5.5sec
    • Median = 5sec
More Warning (truth) alerts issued when Tau DWC definition used
  - No Tau = 40
  - Tau = 67

Warnings typically lasted less than 10sec
  - However, Tau candidate led to more alerts w/ 20sec duration

Avg. Warning alert duration
  - No Tau = 10.9sec
    • Median = 8sec
  - Tau = 12.4sec
    • Median = 8sec
• Warning (truth) alerts most common during the Turn Into encounter types
  – **58 Warning** alerts issued against Turn Into encounters
• Warnings less common with Turn In Front & Unscripted encounters
  – Turn In Front = 16
  – Unscripted = 33
• Avg. Warning duration
  – Turn Into = 15.2sec
    • Median = 15sec
  – Turn In Front = 7.3sec
    • Median = 6sec
  – Unscripted = 7.5sec
    • Median = 6sec
Aircraft Response Time

- **Aircraft Response Time** = time to upload a maneuver to the aircraft following the onset of a Corrective or Warning alert (whichever appeared first)
- Difficult to capture response times to Corrective alerts – not visible in all conditions and (as shown earlier) they were typically of short duration
- Pilots respond slightly faster to Warning alerts in the No Tau DWC condition
  - Later alerting w/ No Tau means that the threat is often more apparent by the time an alert is issued

SEPARATION DATA
Losses of DAA Well Clear (Counts)

- Loss of DAA Well Clear (LoDWC) Criteria:
  - **No Tau**: Horz=1500ft, Vert=450ft, no tau
  - **Tau**: Horz=1500ft, Vert=450ft, 15sec modTau, 1500ft DMOD
- For reference: 82 LoDWC in TOPS 1 against similar encounters
- Tau had 10 more LoDWC than No Tau (also had larger hazard zone)
  - Tau candidate had more than twice as many LoDWC in the With Corrective alerting configuration

**Total # LoDWC**

<table>

</tbody>
</table>
Losses of DAA Well Clear (Proportions)

- Proportion of losses of DAA Well Clear (LoDWC)
  - # of LoDWC / # aircraft that generated a DAA Corrective or Warning
- For All Encounters, identical proportion of LoDWC between No Tau and Tau DWC candidates
- LoDWC was most common against Turn Into encounters
  - 32 total were scripted (per condition), but one encounter failed to generate in each
  - Twice as many LoDWC with Tau candidate
- 0 LoDWC in Turn In Front encounter type
- 3 total LoDWC against Unscripted encounters (all in Tau condition)
Losses of DAA Well Clear (Severity)

- Phase 1 SLoWC = % of the **Phase 1** DAA well clear volume (which includes tau) penetrated by intruder
  - Higher % = greater penetration
- No substantial effect of DWC candidate or alerting configuration
  - No Tau & Tau DWC candidates led to

Better 0

DWC Candidate
• Phase 1 SLoWC ranged overall from 20-72%
  – Highest SLoWC seen in With Corrective alerting configuration
• Fewer high-severity SLoWC with current DWC candidates than seen in TOPS 1
• Closest point defined as minimum slant range with \textit{vertical separation} < 450ft

• 22\% (4/18) of LoDWC in the Tau DWC candidate came within 1500ft horizontal separation (i.e., violated the No Tau candidate criteria)
  
  – 4 intruders came within 1215ft horizontal separation (the lower-bound recommendation)
• Closest point defined as minimum slant range *with vertical separation* < 450ft
• Tau candidate adds approximately 1000ft additional minimum horizontal separation
• Minimum vertical constant across the four conditions
• No clear effect of alerting configuration

**Avg. Minimum Separation at Closest Point in LoDWC**

Losses of DAA Well Clear (Causes)

• Pilot responsible for LoDWC:
  – 38% (3/8) of time with No Tau candidate
  – 33% (6/18) of time with Tau candidate
    • Only one entered No Tau boundary

• Late acceleration was a disproportionate contributor to LoDWC
  – 38% (3/8) of time with No Tau
  – 56% (10/18) of time with Tau

• Proportion of LoDWC drops significantly when only including pilot-responsive

All Encounters

DWC Candidate
- No Tau
- Tau

Proportion LoDWC

- All LoDWC
- Pilot-Responsive LoDWC Only

[Graphs and diagrams showing data and comparisons]
• SLoWC drops substantially when only including pilot-responsible LoDWC
  – Approx. reduction of 12-16% SLoWC
  – No noticeable difference between DWC candidates
• The No Tau candidate had 0 SLoWC above 50% with pilot responsible
• The Tau candidate had 2 SLoWC above 50% & 0 SLoWC above 70% (both due to ‘pilot hesitation’)
  – For reference: TOPS 1 had 17 SLoWC above 50% & 6 SLoWC above 70% with pilot responsible

- TOPS 1 had 17 SLoWC above 50% & 6 SLoWC above 70% with pilot responsible.
MANEUVERING & ATC INTEROPERABILITY
• Heading changes and missed approaches (or go-arounds in visual scenario) were most likely in the Turn Into encounter type
  – Even split between heading changes and missed approaches
• Pilots relied on speed reductions almost exclusively to resolve perceived conflicts in the Turn In Front and Unscripted encounter types
  – Larger number of maneuvers seen for Tau DWC candidate, largely a result of more speed decreases against Unscripted encounters

**Initial Maneuver Types**

<table>

</table>
Pilots were most consistent when coordinating a missed approach/go-around
  – Pilots fairly consistent in coordinating heading changes, slightly more so in Tau condition

Speed decreases were rarely coordinated
ATC coordination was ~20% in TOPS 1

When pilots did coordinate, it was typically after they had made their maneuver
  – 67% of coordination occurred after the maneuver had been made (identical rate for missed & non-missed approach maneuvers)
• Both DWC candidates appropriately tailored to the operational environment
  – Substantially fewer high-severity LoDWC than TOPS 1
    • The 2 candidates had identical avg. Phase 1 SLoWC when including only pilot-responsible
  – Response times returned to expected averages (consistent with PT6)
  – Pilots did not report noticing a difference between the candidates during debrief
• Tau candidate generated more alerts and more LoDWC, however:
  – Tau candidate led to more LoDWC overall but they typically stayed outside of the 1500ft x 450ft boundary
  – Additional alerts not found to correspond with more disruptive maneuvers – pilots relied heavily on speed reductions
• Corrective alerts continue to show lack of utility in the terminal area
  – Corrective duration grand mean = 7sec (median = 5sec)
  – 81% (61/75) of time short duration Correctives failed to progress to a Warning
  – Pilot performance in the No Corrective alerting configuration either did not differ from or was better than performance in With Corrective condition

**No Corrective**

Warning (Truth) Alert

Regain DWC Guidance

**With Corrective**

Warning (Truth) Alert

Regain DWC Guidance
After each encounter, tower controller answered the following questions:

- Tower rated UAS behaviors as overwhelmingly appropriate
  - UA pilots were able to detect appropriate traffic
  - Disruptive turn-outs on instrument approach where pilots should have executed missed approach
  - 1.5 nm separation on approach worked for simulation

- Pilot responses to traffic on final was left to their discretion – although training emphasized the expectation to go missed/go-around
  - During debrief pilots explained that they (often) reflexively looked to make a heading change as a way to immediately increase separation
  - Altitude bands typically indicated that a climb would not resolve the conflict
DAA Alerts Without a Maneuver

- Tau DWC candidate had far more instances of a DAA alert that did not lead to a UAS maneuver
  - No Tau = 7 alerts w/o maneuver
  - Tau = 40 alerts w/o maneuver
- 62% (29/47) of these cases were against a Corrective alert

- None of these alerts resulted in a loss of DWC
  - Avg. alert duration = 6sec
40 total maneuvers were made against traffic that did not register a DAA alert
  - Evenly distributed between the 2 DWC candidates

Maneuvers were typically speed decreases to provide enough space for aircraft in front
  - No Tau had minority of climbs and heading changes against non-alerted traffic
Unscripted Encounter Types

- Tau candidate was far more likely to alert to unscripted traffic, particularly jet traffic and traffic turning to base
  - Jet traffic approached KSTS from the NE before getting established on a 5nm straight-in; during the Instrument approach scenario, it briefly pointed at UA
- Discrepancy between conditions is smaller when comparing # of maneuvers
  - No Tau candidate actually led to more maneuvers than alerts; Tau candidate had ~1/2 as many maneuvers than alerts

- Count of Corrective/Warning alerts and maneuvers against unscripted traffic types by DWC candidate:

<table>

</table>
• Speed changes were the most common type of maneuver made (94 total)
• Missed Approaches & Heading Changes were equally common (43 vs. 42)
  – Missed approach more prevalent in Instrument
  – Heading changes more common in Visual
• Pilots occasionally saved their missed approach for a later upload
• Worst case was with the Tau DWC candidate, With Corrective alert config.
  – Instrument scenario
  – ‘Late Acceleration’ – *lost DWC at the same time it became a warning*
  – Pilot exacerbated it by turning with the traffic and delaying a climb
• No Tau candidate had fewer alerts
  – None occurred far away from the 2 downwind legs
• Tau candidate had more alerts overall with several occurring far away from runway
  – Tau candidate was more consistent in *where* the intruder was at first alert
• How did pilots continue the approach when they maneuvered for traffic but did not go missed?
  – **Re-Engage**: turn back to final and/or continue descent
  – **Runway Heading**: turn back toward runway without engaging descent
  – **Re-Fly**: made a 360 or enter the right/left downwind to re-do the approach entirely
• In Instrument scenario, pilots most often tried to re-engage the approach
• In Visual scenario, pilots most often re-flew the approach
LoDWC_LaRC typically started with ownship established on final with intruder still near right/left downwind (likely at the start of the turn base)

Legend:
- Ownship Position, Instrument Approach
- Ownship Position, Visual Approach
- Intruder Position, Instrument Approach
- Intruder Position, Visual Approach

Rwy14
• CPA typically occurred once the intruder neared or crossed our final approach path
