Terra Mission Overview

Terra Features

- **Launch Date:** December 18, 1999 (Atlas IIAS, VAFB)
- **Orbit:** 705 km, Sun-synchronous polar, 98.2° Inclination, 10:30 AM MLT descending node
- **Instrument Payload:**
  - ASTER (SWIR, TIR & VNIR) - Advanced Spaceborne Thermal Emission and Reflection Radiometer (Japan)
  - CERES (Fore & Aft) - Clouds and the Earth's Radiant Energy System (USA – Langley)
  - MISR - Multi-angle Imaging Spectro-Radiometer (USA – JPL)
  - MODIS - Moderate Resolution Imaging Spectro-radiometer (USA – GSFC)
  - MOPITT - Measurement of Pollution in the Troposphere (Canada)
- **Project Management:** Earth Science Mission Operations (ESMO)
- **Spacecraft Flight Operations:** Contracted by GSFC to KBR team and supported by NASA NENs and TDRSS
- **Instrument Operations and Science Data processing:** Performed at respective Instrument Locations where developed
- **Mission Duration:** Successfully completed Prime mission of 5 years. Currently in Extended Operations.
- **Distributed Active Archive Centers:** LP DAAC – MODIS, ASTER; Langley DAAC – CERES, MISR, MOPITT

Science

- The primary objective of the Terra Mission is to simultaneously study clouds, water vapor, aerosol, trace gases, land surface and oceanic properties, as well as the interaction between them and their effect on the Earth’s energy budget and climate.
• **May 2017**: Mission Extension Senior Review Proposal Panel Report
  – Mission extension through **FY23**
  – Senior Review submission delivered in Mar 2017

• **2018 Inclination Adjust Maneuvers**
  – Spring 2018 Inclination Maneuvers
    – IAM #51 – February 22nd
  – Summer 2018 Inclination Maneuvers
    – IAM #52 – June 20th or 27th
  – Fall 2018 Inclination Maneuvers
    – IAM #53 – November 01st

• **12/18/17**: Terra 18-Year Anniversary
  – 5-Year Design Life, 6 year goal
  – Reliability Estimates thru 2025+
  – Consumables through 2020+

• **January 2019**: EOS Flight Operations Annual Review #13
Terra Spacecraft Status

1 Change

All subsystems on Primary Hardware except as noted

- **Command & Data Handling (CDH)** – **Nominal**
  - Solid State Recorder (SSR) – holds ~1 orbit of data
  - 11 of 58 SSR Printed Wire Assembly tripped off resulting in reduced recording capacity

- **Communications (COMM)** – **Nominal**
  - DAS Modulator Failure on 05/29/2008 (Operating on Redundant)
  - Use K-Band primarily, X-Band as needed for Science Playback

- **Electrical Power System (EPS)** – **Good**
  - Battery Cell and Heater Controller Anomaly (10/13/2009)
  - 1 of 24 Solar Panel Failed (9/24/2000)

- **Flight Software (FSW)** – **Nominal**

- **Guidance, Navigation & Control (GN&C)** – **Nominal**
  - Minor loss of sensitivity in SSSTs – updated tracker biases to compensate

- **Propulsion (PROP)** – **Nominal**

- **Thermal Control System (TCS)** – **Nominal**

- **Instruments (INST)** – **Nominal**
  - Only ASTER SWIR failed, all other instruments are taking science
## Spacecraft Component Status

Terra RMM and Box Violation

- Terra successfully conducted an RMM on March 16 to mitigate a close approach.
- The burn magnitude executed targeted a solution just inside the edge of the 20km science box:
  - Box limit was estimated to be 3.56 cm/sec
  - Maneuver planned was 3.54 cm/sec; Actual performance was 3.58 cm/sec
- Following this maneuver actual atmospheric drag became much lower than predicted. Therefore, current predictions are now showing Terra will drift outside of its science control box on July 4th or 5th, 2018.

Example showing typical relationship between predicted and definitive atmospheric density (from November 2017)

Plot spans 3/11/18 through 5/10/18. The dotted line is the burn epoch (3/16/18).
GTE Prediction (Do Nothing Option)
Changing Fall Yaw Angle helps with upper MLT violation (June 13th still violates). 10:15 MLT crossing is close to baseline. Trajectories exit MLT box between Jan 19-28, 2021.

Jun 13 trajectory violates MLT boundary between Dec 10 2018-Jan 31 2019; max MLT of Jun 20 trajectory is 10.51652
## Maneuver Options MLT and Lifetime Comparison

<table>

<td>28 Dec 2025</td>
<td>19 Dec 2025</td>
<td>16 Dec 2025</td>
<td>16 Dec 2025</td>
</tr>
</tbody>
</table>

*Includes Exit maneuvers on 24 Aug 2022

- Tight MLT exit date is extended or preserved
- Mission MLT and Overall Lifetime impacted by approximately one week
Inclination Adjust Maneuvers

• Inclination Adjust Maneuvers used to maintain nominal spacecraft mean local time (descending node) of 10:30 AM
  – 02/22/2018 IAM #51 (320 sec burn) executed successfully
  – June 2018 IAM #52 being considered
  – Fall 2018 IAM #52 (320 sec burn) planned
    IAM #53 (320 sec burn) planned

• Predictions indicate need to perform 3-4 maneuvers per year
  – 2017: (2 in Spring, 2 in Fall) -- COMPLETE
  – 2018: (1 in Spring, 2 in Fall) – Spring IAM complete, 1 Summer IAM being considered
  – 2019: (2 in Spring, 1 in Fall)
  – 2020: (2 in Spring, 0 in Fall) -- last inclinations for Terra mission

**CARA Defines the 4 Tiers as:**
- **T1** – Notify (email/phone)
- **T2** – Conduct Briefing
- **T3** – Plan Maneuver
- **T4** – Execute Maneuver

- **2005**: 4 HIEs – 1 Debris Avoidance Maneuver (DAM) performed on 10/21/2005: Terra vs. 14222 CA on 10/23
- **2006**: 1 HIE – 1 maneuver waived off due to CA. Maneuver originally planned for 01/12/2006: Terra vs. 1716 CA on 1/12@ 17:46z
- **2007**: 4 HIEs – 1 DAM performed on 06/22/2007: Terra vs. 31410 CA on 6/23
- **2008**: 2 HIEs – 1 DAM planned and waived off: Terra vs. 82832 CA on 10/28/2008 @ 06:17z
- **2009**: 2 HIEs – No DAMs planned or performed
- **2010**: 5 HIEs – 1 DAM performed on 01/22/2010: Terra vs. 34700 CA on 1/23 @ 20:46z
- **2011**: 20 HIEs – 2 DAM planned and waived off: (1) Terra vs. 26181 CA on 3/28/2011 @ 12:14z (2) Terra vs. 30440 Repeating CA 05/07-09/2011
- **2012**: 19 HIEs – 1 maneuver waived off due to CA. Maneuver originally planned for 05/31/2012: Terra vs. 37789 CA on 6/1 @ 22:49z
- **2013**: 17 HIEs – 7 that required significant action
- **2014**: 24 HIEs – 6 that required DAM execution or nominal maneuver waive-off and replanning
- **2015**: 33 HIEs – 8 that required DAM execution or nominal maneuver waive-off and replanning
- **2016**: 11 HIEs – 0 that required DAM execution or nominal maneuver waive-off and replanning
- **2017**: 8 HIEs – 1 that required DAM execution or nominal maneuver waive-off and replanning
- **2018 thru present**: 2 High Interest Events (HIEs) – 1 that required DAM execution or nominal maneuver waive-off and replanning
  - RMM #12 executed on 3/16/18 – Terra vs. 33666 with TCA of 03/16/18 @ 17:35z
ESMO RMM Planning Automation

- ESMO has updated its Close Approach (CA) Process Flow to move towards a more automated approach
  - Prepares for future increased object catalog w/ Space Fence
  - Reduces workload for each event
  - Keeps solution “at the ready” for short notice events
- ESMO Flight Dynamics team has developed an autonomous ephem generation tool
- Ephems built off optimal and constrained cases solved for by the Collision Risk Management System (CRMS)
- CARA accepts delivery of these ephems and ships them to JSpOC for screening
  - Delivery to CARA is now automatic based on logic built into the FDS ephem tool to whittle ephems down from maximum of eight generated to a maximum of five delivered
  - Any other options needed can be sent manually
- Screening results automatically compiled and outputted via an email report from CRMS
- Auto Ephem Generation implemented in February 2017
- Auto Ephem Delivery implemented in February 2018
Document Status

- Rev D - End-of-Mission Plan Document has been revised and under review cycle
- Hope is to have signed version in CM this summer

Content

- Terra will continue normal operations through October 2020
- Once all non-reserved fuel has been used, MLT will be drifted to 10:15 AM
- January 2022, Terra exits constellation
- Remain fuel used to lower perigee prior to spacecraft passivation
- Exit plan is consistent with the current Constellation Operations Coordination Plan

Summary

• Terra remains very healthy 17+ years into the mission
  • Electrical Power Subsystem performance has been stabilized following 2009 anomaly
  • Fuel Remaining to continue operations to 2020 and beyond

• Data Capture percentages continue at ~100%

• Collision Avoidance events continue to be part of routine ops
  – Low atmospheric drag is providing additional challenges

• End of Mission Plan (Rev D) currently out for signatures
  – Goddard signed/approved version made it to NASA HQ on 05/11/18
  – Target completion date is Summer 2018
FUTURE PLAN*

*Will be updated if a Summer IAM is executed

Conclusion/Summary

• It was determined officially that Terra does **not** require waivers

• Based on that fact, the decision for Terra’s future was in the hands of the Earth Science Division @ NASA HQ

• **We received written approval in February 2018 to proceed ahead with our proposed maneuver plan**

• Plan is for Terra to Exit Constellation in early 2022 and end mission in early 2026
Questions

• Orbit / Inclination / MLT Maintenance
• WRS Ground Track Error
• EPS Performance
• Drag Model Info
• OSMA Waiver Email
• NASA HQ Email
Orbit/Inclination/MLT Maintenance

- **Requirement:** Mean Local Time (MLT) maintained between 10:15 and 10:45 measured at the Descending Node.

- **Goal:** Maintain Terra mean local time of the descending node (MLTDN) below 10:31.

- **Constraint:** OCO-2 has requested Terra maintain a MLT less than 10:31 for the duration of its lifetime to maintain a safe separation at the poles.

- **Requirement:** Maintain WRS-2 ground track error, 0 +/-20 km.

- **Requirement:** Maintain Frozen orbit with Argument of Perigee at 90 degrees +/-20 and Eccentricity of 0.0012 +/- 0.0004.

- **Constraint:** Maximum burn duration limited to 320 seconds by spacecraft manufacturer. Complete yaw slews and inclination maneuvers during spacecraft orbital night. Maneuver close to spring and fall equinox to maximize efficiency.
WRS Ground Track Error (GTE)

TERRA WRS Groundtrack Error at the Descending Node
(Maneuver planning targets included)
EPS Subsystem Performance

- **Bus Load:** Nominal
  - Average bus load: 2307.221 Watts
  - Average housekeeping current: 11.907 A
  - Total instrument current: 7.120 A

- **Battery Performance:** Nominal with exception of anomalous BBAT condition
  - BBAT cell # 50 failed following IAM #24 on October 13 (DOY 286) 2009
    - BBAT Voltage Temperature curve changed to better reflect a failed cell
  - BBAT heater control electronics (HCE) anomaly occurred following IAM #24 on October 13 (DOY 286) 2009
    - Performed soft reset, power cycle, switching to redundant side and re-enabling one of the nonfunctioning heater groups to recover HCE functionality without success
    - At least 4 of 9 BBAT heater groups are no longer being controlled
    - Heater control setpoints changed for controllable heater groups to reduce the thermal gradient
  - PBAT Charge/Discharge Ratio was reduced from 105% to 104% on April 25, 2013 in an effort to extend PBAT life
  - PBAT BPC Channel A Disabled January 14, 2014; increases BBAT cold temperatures due to increased discharge
  - PBAT Charge/Discharge Ratio was reduced from 104% to 103% on August 20, 2015 in an effort to extend PBAT life

- **Battery Temperatures:** Nominal with exception of anomalous BBAT data
  - PBAT and half of BBAT Battery temperatures are regulated by flight software to ≈ -1°C to -5°C
  - Almost half of BBAT cell temperatures are below normal (but stable) in the -5°C to -13°C range

- **Battery Voltages** (BBAT)
  - Minimum battery voltages at 66.084 Volts

- **Solar Array**
  - Last offset adjustment performed on December 20th, 2017
  - Average drift rate for the month, -0.003 deg/day
  - Present offset drift rate is increasing

- **BBAT Cell with Lowest Temperature** (excluding Cell #50)
  - Cell # 20 : -10.56°C
  - Thermal Gradient(avg): 7.29°C
Atmospheric Density Models

- The two models employed on EOS FDS are called the Jacchia-Roberts model and the Harris-Priester model. These models are described below.

- **Harris-Priester**
  - A table look-up model based on the satellite’s altitude, with a valid range of 86 to 1000 km. The tables are tabulated to the F10.7 density in increments of 25.

- **Jacchia-Roberts (1971)**
  - Time varying atmospheric model which calculates density based on the composition of the atmosphere, dependent on the satellite’s altitude as well as divisional and seasonal variations. Valid range is 100 to 2500 km. Uses latest observed and predicted F10.7 values and geomagnetic indices (GMI).
    - F10.7: The solar radio flux at 10.7 cm (2800 MHz), or F10.7 is an indicator of solar activity. It is one of the longest running records of solar activity.
      - [https://www.swpc.noaa.gov/phenomena/f107-cm-radio-emissions](https://www.swpc.noaa.gov/phenomena/f107-cm-radio-emissions)
    - GMI: The K-index, and by extension the Planetary K-index, are used to characterize the magnitude of geomagnetic activity and storms. The energetic particles that precipitate into the ionosphere add energy in the form of heat that can increase the density and distribution of density in the upper atmosphere, causing extra drag on satellites in low-earth orbit.

Hi Cheryl,

I received you voice mail regarding the question on whether a waiver is needed for the 25 year rule for TERRA. I consulted with J. C Liou on this question we have concluded that a waiver is not needed. Please see the e-mails below. Please let me know if you have any questions.

Best regards,

Sue Aleman

Subject: Re: Terra Future Maneuver Plans Slides

Dimitrios,

Sandra Cauffman has given HQ/ESD concurrence on the IAM plans for Terra through 2020. You're all set for the February maneuvers and beyond.

Have a good weekend,
Charles
