NASA/ Johnson Space Center
12/3/2018
Agenda

• Habulous Background

• CCDD Overview

• CCDD Products used on Habulous
  • C header files that define all software bus commands/telemetry messages
  • Generating file defining the Message ID’s used (cfs_msgids.h)
  • XML Telemetry and Command Exchange (XTCE) files (displays)
  • “Protobetter” code (to manage different endian-ness/architectures)

• Development on Habulous
  • CCSDS_v2 extended headers
  • Extending/customizing SBN to pass messages among computers on multiple networks
  • Using SBN_lib to allow non-cFS node to communicate with cFS nodes

• Next Steps
  • Developing TTE network and schedule tables for all the various CPUs to use
• The Habulous project is an Earth-based testbed (HW/SW)
  • Prototyping future space habitat unit and technologies
  • Representation from various NASA centers and aerospace organizations
    » ARC/JSC/GRC/Goddard/Stennis
• Distributed nature of the team makes data interfaces especially critical
  » Massively heterogeneous computer architectures and operating systems
    – 32/64-bit, Big/Little Endian, Linux/VxWorks/Windows, x86/PPC/Raspberry Pi
• Multiple CPUs use the SBN application to communicate
  » Most CPUs run cFS (use SBN app and Protobetter)
  » Non-cFS CPU (use SBN_lib with Protobetter)
Habulous Block Diagram
CCDD Background

• CCDD stands for cFS Command and Data Dictionary
• Goddard’s Core Flight System (cFS) has been, is, and is intended to be used by many projects
  • Examples: Lunar Reconnaissance Orbiter (LRO), Morpheus, Exploration EMU (xEMU) spacesuit, Orion Backup Flight Software (BFS)
  • Success of the cFS concept is shown by the number cFS projects at FSW-2018
• A command and data dictionary (CDD) defines telemetry/command messages
• Each cFS project must select a way to manage their CDD
  • Frequently involves using a spreadsheet, with custom SW to convert into useful files
• cFS Command and Data Dictionary utility (CCDD) was designed as a generic utility to eliminate duplication of effort in order to make CDD management easier
CCDD Goals

• Create a configurable CDD utility that runs on multiple operating systems
  • Written in Java for maximum portability
• Easy creation/modification of CDD information
  • Graphical user interface (GUI) to interact with the database
• Store all CDD information into a standard database (postgresql)
• Bidirectional transfer of information to/from the CCDD
  • Cut-n-paste to Excel, import/export via XTCE/CSV/JSON
• Easy access to CDD information (via scripting languages and web applications)
  • Allows user to code in various languages (ruby/python/js) and access CDD information
    » Create vehicle and ground software products, data summary, etc
    » Generate complicated CFS products: Schedule or network tables, copy table, etc
Data is accessible to scripting languages (JavaScript, Python, etc.)
  • Example scripts provided for common products

Imported/exported via:
  • CSV (comma-separated values)
  • JSON (JavaScript Object Notation)
  • XML (Extensible Markup Language)
    » EDS (Electronic Data Sheet)
    » XTCE (XML Telemetric and Command Exchange)
  • OS clipboard (“cut & paste”)

Web-based dataserver (JSON)
### CFS Command & Data Dictionary 1.4.1

</tbody>
</table>
• cfs_msgids.h file generation
  • Same file compiled by all CPUs
  • Defines all the MIDs for each cFS message sent/received on any of the various CPUs
• Using CCSDSv2, so each MID is a combination of APID/SystemID/SubSystemID
• Using the CCDD information to automatically generate the C-header files
  • Define the structure for all software bus (SB) commands/telemetry messages
• Generate XML Telemetry and Command Exchange (XTCE) files
  • Used by display team to make displays for any CPU
• Generating “Protobetter” code for communication with other CPUs
  • Manages packing and different endian-ness/architectures
Habulous MID definition

Telemetry

Command

2018 used by AES

Keep 32-bit alignment
Major Habulous Activity in 2018

- Updating to CCSDS_v2 (and using CPU# as subsystem ID)
  - Running out of room for unique MIDs on all CPUs for the 11-bits of version 1
  - See next slide
- Exporting XTCE files to allow drag-n-drop display development for all CPUs
- Extending/customizing SBN to pass messages to computers
  - Computers with multiple interfaces act as a “bridge” to CPUs that can’t talk directly
  - “Protobetter” developed to manage packing/ endian differences
- Using SBN_lib to allow non-cFS node to communicate with cFS nodes
  - Allows non-cFS nodes to “impersonate” a cFS node and talk to SBN on other CPUs
- Worked to develop the CDD before the SW development was complete
  - Not treat CDD as an “as built” post-development documentation effort
  - Required iterations on data structures and MIDs, but minimized interface issues
Future Work

• The CCDD tool has successfully been used to automate/autocode a large amount of software used on Habulous.

• Working to allow the CCDD to define even more products including:
  • Time-triggered Ethernet (TTE) network tables/maps
    » Coordinate message passing between various synchronized machines
  • cFS schedule table (for each CPU)
  • Automated CCDD to SysML export
