Overview of Past Lunar *In Situ* Resource Utilization (ISRU) Development by NASA

Presentation to ESA Workshop: Towards the Use of Lunar Resources
July 3, 2018

Gerald B. Sanders, NASA
gerald.b.sanders@nasa.gov
(281) 483-9066
What is *In Situ* Resource Utilization (ISRU)?

ISRU involves any hardware or operation that harnesses and utilizes ‘in-situ’ resources to create products and services for robotic and human exploration.

**Resources**
- Traditional: Water, atmospheric gases, volatiles, solar wind volatiles, metals, alloys, sunlight, etc.
- Non-traditional: Trash and wastes from crew, spent landers and residuals, etc.

**Resource Assessment (Prospecting)**
- Assessment and mapping of physical, mineral, chemical, and water resources, terrain, geology, and environment

**Resource Acquisition**
- Atmosphere constituent collection, and material/volatile collection via drilling, excavation, transfer, and/or manipulation before Processing

**Resource Processing/Consumable Production**
- Conversion of acquired resources into products with immediate use or as feedstock for construction & manufacturing
  - Propellants, life support gases, fuel cell reactants, etc.

**In Situ Manufacturing**
- Production of replacement parts, machines, and integrated systems from feedstock derived from one or more processed resources

**In Situ Construction**
- Civil engineering, infrastructure emplacement and structure construction using materials produced from *in situ* resources
  - Radiation shields, landing pads, roads, berms, habitats, etc.

**In Situ Energy**
- Generation and storage of electrical, thermal, and chemical energy with *in situ* derived materials
  - Solar arrays, thermal storage and energy, chemical batteries, etc.

- ‘ISRU’ is a capability involving multiple elements to achieve final products
- ‘ISRU’ does not exist on its own. Must connect and tie to users/customers of ISRU products
Space ‘Mining’ Cycle: Prospect to Product

Resource Assessment (Prospecting)
- Global Resource Identification
- Local Resource Exploration/Planning

Mineral Processing
- Crushing/Sizing/Beneficiation

Site Preparation & Infrastructure Emplacement

Maintenance & Repair

Crushing/Sizing/Beneficiation

Product Storage & Utilization
- Waste
- Spent Material Removal

Life Support & EVA
- Habitats
- Power
- Propulsion
- Depots
ISRU Changes How We Can Explore Space

**Risk Reduction & Flexibility**
- >7.5 kg mass savings in Low Earth Orbit for every 1 kg produced on the Moon or Mars
- Chemical propellant is the largest fraction of spacecraft mass
- Number of launches & mission operations reduced
- Use of common hardware & mission consumables enables increased flexibility
- In-situ fabrication of spare parts enables sustainability and self-sufficiency
- Radiation & landing/ascent plume shielding
- Reduces dependence on Earth

**Mass Reduction**
- Develops alternative & renewable energy technologies
- New additive construction
- CO₂ remediation
- Green metal production

**Cost Reduction**
- Allows reuse of transportation systems
- Reduces number and size of Earth launch vehicles
- Increase Surface Mobility & extends missions
- Habitat & infrastructure construction
- Substitutes sustainable infrastructure cargo for propellant & consumable mass

**Solves Terrestrial Challenges & Enables Space Commercialization**
- Provides infrastructure to support space commercialization
- Propellant/consumable depots at Earth-Moon L1 & Surface for Human exploration & commercial activities
- Number of launches & mission operations reduced
- Use of common hardware & mission consumables enables increased flexibility
- In-situ fabrication of spare parts enables sustainability and self-sufficiency
- Radiation & landing/ascent plume shielding
- Reduces dependence on Earth

**Expands Human Presence**
- >7.5 kg mass savings in Low Earth Orbit for every 1 kg produced on the Moon or Mars
- Chemical propellant is the largest fraction of spacecraft mass
- Number of launches & mission operations reduced
- Use of common hardware & mission consumables enables increased flexibility
- In-situ fabrication of spare parts enables sustainability and self-sufficiency
- Radiation & landing/ascent plume shielding
- Reduces dependence on Earth
ISRU for Lunar Missions

- **Lunar Resource Prospecting & Mine Planning**
  - Terrain and surface feature mapping
  - Surface/subsurface mineral and glass concentration & distribution mapping
  - Solar wind & polar volatile concentration & distribution mapping

- **Mission Consumable Production**
  - Complete Life Support/Extra Vehicular Activity closure for Oxygen (O\textsubscript{2}) and water (H\textsubscript{2}O)
  - Produce/regenerate Fuel Cell Reactants (in conjunction with Power)
  - Gases for science and cleaning
  - **Propellant production:** O\textsubscript{2} and fuel (H\textsubscript{2} and/or CH\textsubscript{4}) for robotic and human vehicles

- **Site Preparation and Outpost Deployment/Emplacement**
  - Site surveying and terrain mapping
  - Crew radiation protection (In-situ water production or bulk regolith)
  - Landing area clearing, surface hardening, and berm building for Lunar Lander landing risk and plume mitigation
  - Area and road clearing to minimize risk of payload delivery and emplacement

- **Outpost Growth and Self-Sufficiency**
  - Fabrication of structures that utilize in-situ materials (with Habitats)
  - Production of feedstock for fabrication and repair (with Sustainability)
  - Solar array, concentrator, and/or rectenna fabrication (with Power)
  - Thermal energy storage & use from processed regolith (with Power)
Lunar ISRU Mission Capability Concepts

- Resource Prospecting – Looking for Polar Ice
- Excavation & Regolith Processing for O₂ Production
- Carbothermal Processing with Altair Lander Assets
- Thermal Energy Storage Construction
- Landing Pads, Berm, and Road Construction
- Consumable Depots for Crew & Power
Use the Moon as a Precursor to Mars

- Identify and characterize available resources (especially polar region) that:
  - Strongly influence mission phases, locations, and designs to achieve maximum benefit of ISRU
  - Is synergistic with Science and space commercialization objectives
  - Is synergistic with surface water characterization on Mars

- Demonstrate ISRU concepts, technologies, & hardware that reduce the mass, cost, & risk of human Mars missions
  - Excavation and material handling & transport
  - Volatile/hydrogen/water extraction
  - Thermal/chemical processing subsystems for oxygen and fuel production
  - Cryogenic fluid storage & transfer
  - Trash/Waste Processing in conjunction with Life Support
  - Metal extraction and fabrication of spare parts

- Use Moon for operational experience and mission validation for Mars
  - Pre-deployment & remote activation and operation of ISRU assets without crew
  - Making and transferring mission consumables (propellants, life support, power, etc.)
  - Landing crew with pre-positioned return vehicle or ‘empty’ tanks
  - ‘Short’ (<90 days) and ‘Long’ (300 to 500 days) Mars surface stay dress rehearsals

- Develop and evolve surface exploration assets linked to ISRU capabilities that enable new exploration capabilities
  - Human and robotic hoppers for long-range surface mobility and global science access; power-rich distributed systems; enhanced radiation shielding, etc.
  - Repair, fabrication, and assembly techniques to mitigate mission risk and logistics mass.
Lunar Resources & Products of Interest

LUNAR RESOURCES

MARE REGOLITH

Ilmenite - 15%
FeO•TiO₂ 98.5%

Pyroxene - 50%
CaO•SiO₂ 36.7%
MgO•SiO₂ 29.2%
FeO•SiO₂ 17.6%
Al₂O₃•SiO₂ 9.6%
TiO₂•SiO₂ 6.9%

Olivine - 15%
2MgO•SiO₂ 56.6%
2FeO•SiO₂ 42.7%

Anorthite - 20%
CaO•Al₂O₃•SiO₂ 97.7%

VOLATILES (Solar Wind & Polar Ice/H₂)

Hydrogen (H₂) 50 - 150 ppm
Helium (He) 3 - 50 ppm
Helium-3 (³He) 10⁻² ppm
Carbon (C) 100 - 150 ppm
Polar Water (H₂O)/H₂ 1 - 10%

Hydrogen Reduction of Ilmenite/glass Process

Fluidized Bed Reactor

2FeTiO₃ + 2H₂ → 2Fe + 2TiO₂ + 2H₂O

Water electrolysis

O₂ + 2H₂ → 2H₂O

Desolve/Digest Reactor

2FeTiO₃ + 2H₂SO₄ → 2H₂O + 2FeSO₄ + 2TiO₂

Electrolysis bed

O₂ + 2Fe + 2H₂SO₄ → 2H₂O + 2FeSO₄

Methane Reduction Furnace

2FeTiO₃ → 2TiO₂ + 2Fe
Fe₂SIO₄ → 2FeO + Si
FeSIO₃ → FeO + Si
Mg₂SiO₄ + 2CH₄ → 2CO + 4H₂ + 2MgO + Si
MgSiO₃ → MgO + Si
CaSiO₃ → CaO + Si

Methane + 2CH₄ → 2CO + 6H₂

Water electrolysis

O₂ + 2H₂ → 2H₂O

Molten Electrolysis Reactor

2SiO₂ → 2SiO + O₂
2FeTiO₃ → 2Fe + 2TiO₂ + O₂
2FeO → 2Fe + O₂

Pyrolysis Reactor/Condenser

2SiO₂ → 2SiO + O₂
2Fe₂TiO₃ → 2Fe + 2TiO₂ + O₂
2FeO → 2Fe + O₂
2Al₂O₃ → 2Al + 2O₂
2Al₂O₃ → 2Al + 2O₂
2MgO → 2Mg + O₂
2CaO → 2Ca + O₂
2CaAl₂Si₂O₈ → 2Ca + 4AlO + 4SiO + 4O₂
2CaAl₂Si₂O₈ → 2Ca + 2Al + 2Al + 4SiO + 5O₄

Vapor Pyrolysis Process

Thermal Volatile Extraction

H₂O/H₂ 1 - 10%
## Global Assessment of Lunar Volatiles

### Apollo Samples

- **Instrument**: Apollo samples
- **Concentration**: Hydrogen (50 to 150 ppm)
- **Location**: Sunlit everywhere
- **Environment**: Top several meters; Gardened

### Moon Mineralogical Mapper (M³)

- **Instrument**: Apollo samples
- **Concentration**: 0.1 to 0.3 wt % water in Apatite
- **Location**: Regolith
- **Environment**: Sunlit

### Water/Hydroxyl

- **Instrument**: Apatite
- **Concentration**: 0.1 to 1% water; 1-2% frost in shadowed craters
- **Location**: Upper latitudes
- **Environment**: Low sun angle; Permanent shadow <100 K

### Polar Volatiles

- **Instrument**: M3/DIVINER
- **Concentration**: Solar wind & cometary volatiles (CO, H₂, NH₃, organics)
- **Location**: Poles
- **Environment**: Low or no sunlight; Temperatures sustained at <100 K

### Polar Ice

- **Instrument**: LCROSS
- **Concentration**: Ice layers
- **Location**: Poles; Permanent shadowed craters
- **Environment**: <100 K, no sunlight

### Lunar Crater Observation & Sensing Sat. (LCROSS)

- **Instrument**: Mini SAR/RF
- **Concentration**: Top mm's of regolith
- **Location**: Below 10 to 20 cm of desiccated layer
- **Environment**: Top 2 meters
Development of Lunar ISRU Technologies & Systems

- **Resource Characterization & Mapping**
  - Lunar polar ice/volatile characterization
    - RESOLVE/Resource Prospector

- **Mission Consumable Production**
  - Oxygen Extraction from Regolith
    - Hydrogen Reduction
    - Carbothermal Reduction
    - Molten Oxide Electrolysis
    - Ionic Liquids
  - Oxygen and Fuel from Mars Atmosphere
    - Carbon Dioxide Capture
    - Mars Soil Drying
  - Water and Fuel from Trash
    - Steam Reforming
    - Combustion/Pyrolysis
  - Water Processing
    - Water Electrolysis
    - Water Cleanup

- **In-Situ Energy Generation, Storage & Transfer**
  - Solar Concentrators
  - Heat Pipes

- **Civil Engineering & Surface Construction**
  - Lunar Regolith Excavation
  - Lunar Regolith and Mars Soil Transfer
  - Lunar Regolith Size Sorting & Beneficiation
  - Lunar Regolith Simulant Production
  - Surface Preparation
NASA ISRU Soil/Water Extraction and Trash Processing Technology Development

**Soil Acquisition and Excavation**
- Sample drills and augers (JPL, ARC, SBIRs)
- Scoops and buckets (GRC, KSC, JPL, Univ., SBIRs)
- Auger and pneumatic transfer (KSC, GRC, SBIRs)

**Water Extraction from Soils**
- Closed soil reactors: fluidized & auger (JSC, SBIRs)
- Microwave soil processing (MSFC, JPL, SBIR)
- Open soil processing reactors (GRC)
- Downhole soil processing (MSFC, SBIRs)
- Capture for lunar/Mars soil processing (NASA, SBIRs)
- Water cleanup for lunar/Mars soil processing (KSC, JSC, SBIRs)

**Trash/Waste Processing into Gases/Water**
- Combustion, Pyrolysis, Oxidation/Steam Reforming (GRC, KSC, SBIRs)
Lunar Processing – Oxygen & Metal Extraction

Hydrogen Reduction of Regolith

- Two Fluidized H₂ Reduction Reactors - 10 kg/batch each (>900 °C)
- Water Electrolysis Module
- Water Electrolysis Module
- O₂ Cryo Tank
- Hydrogen Storage Reactor

1. Heat Regolith to >900 °C
2. React with Hydrogen to Make Water
3. Crack Water to Make O₂

PILOT
- 250 kg O₂ per year
- Lift System and Auger Loading
- Bucket Drum Excavator (IR&D)
- Dump Chute

Carbothermal Reduction of Regolith

- Solar Concentrator & Fiber-optic Cables
- Regolith Reduction Chamber
- Pneumatic Lift System and Auger Loading

1. Melt Regolith to >1600 °C
2. React with Methane to produce CO and H₂
3. Convert CO and H₂ to Methane & Water
4. Crack Water to Make O₂

Molten Electrolysis of Regolith

1. Melt Regolith to >1600 °C
2. Apply Voltage to Electrodes To Release Oxygen
ISRU Development: System Testing and Integration Through Analog Field Tests

Hardware & Operation Integration at 2008 Analog Field Test

ISRU
It’s not about being able to do ISRU. It’s not about having the most efficient ISRU system.

It is about achieving the benefits of ISRU for a reasonable cost, mass, and risk.
Thank You

Questions?
# Main Natural Space Resources of Interest for Human Exploration

## Water (Hydrogen)
- **Moon:** Icy Regolith in Permanently Shadowed Regions (PSR)
- **Mars:** Solar wind hydrogen with Oxygen

## Oxygen
- **Moon:** Minerals in Lunar Regolith: Ilmenite, Pyroxene, Olivine, Anorthite
- **Mars:** Carbon Dioxide in the atmosphere (~96%)

## Carbon (Gases)
- **Moon:** CO, CO₂, and HC’s in PSR
- **Mars:** Solar Wind from Sun (~50 ppm)
- **Asteroids:** Carbon Dioxide in the atmosphere (~96%)

## Metals
- **Moon:** Iron/Ti: Ilmenite
- **Mars:** Minerals in Mars Soils/Rocks
- **Asteroids:** Minerals in Regolith/Rocks on S-type Stony Iron and M-type Metal Asteroids

## Uses
- **Moon:** Drinking, radiation shielding, plant growth, cleaning & washing
- **Mars:** Making Oxygen and Hydrogen
- **Asteroids:** Breathing, Oxidizer for Propulsion and Power
- **Moon & Mars:** Fuel Production for Propulsion and Power, Plastic and Petrochemical Production
- **Asteroids:** In situ fabrication of parts, Electrical power generation and transmission

**Note:** Rare Earth Elements (REE) and Platinum Group Metals (PGM) are not driving Resources of interest for Human Exploration.
ISRU Implementation Life Cycle

**Identify Resource & Products**
- Resource Definition
- Prospecting
- Resource Analysis

**Establish Site & Operations**
- Mining Technology Readiness
- Site-Mine Planning
- Site-Mine Development

**Perform Mining Ops**
- Site-Mine Operations & Maintenance
- Processing
- Product and Application

- Determine Resource Utilization
- End Goals
- Initial Feasibility Study
- Multi-Site Evaluation
- Initial Cost Analysis
- Weigh Alternatives
- Go/No-Go Decision
- Plan Program and Approach
- Global Resource Evaluation
- Site Selection
- Site Imaging/Characterization
- Resource Identification and Verification
- Estimate Reserve Size
- Test/Sample Resource Quality
- Understand Geotechnical Properties of Minerals
- Resource Analysis for Other Potential Uses/Users
- Assess Return On Investment
- Demonstrate ‘Scalable’ Hardware
- Demonstrate Operations for All Processes from Extraction to Product Storage
- Evaluate Processing Options
- Select Mining Site
- Environmental Analysis
- Electronic Modeling & Simulation
- Develop Power Sources
- Infrastructure Analysis
- Design Transportation and Comm.
- Contingency Planning
- Infrastructure Development/ Set up
- Site Preparation, Landing, and Roads
- Construct Infrastructure and Processing Facilities
- Excavation
- Resource Extraction
- Manage Operations
- Remediate Site as Needed
- Sort and Refine Resources
- Process Resources Into Feedstocks
- Resource Transfer
- Recycle or Repurpose Wastes or Byproducts for Useful Purposes
- Export Resources from Site
- Convert Resource to Finished Product
- Deliver to End Users

**Pilot Operation – Not Human Mission Critical**
- Decision: Are Resources, Site, & Technology Viable for Exploitation?
- Milestone: Is Site & Infrastructure Ready for Initial Mining?
- Decision: Is Initial Mining and Product Viable for Mission Critical Use?

**Full Operation - Human Mission Critical**
- Decision: Are Resources, Site, & Technology Viable for Full Mining?
- Milestone: Is Site & Infrastructure Ready for Full Mining?
Phased Approach to ISRU Architecture Incorporation

Current approach is to utilize phased approach to incorporate ISRU with minimum risk to mission success

- **Purpose**
  - Characterize local material/resources; evaluate terrain, geology, lighting, etc.
  - Demonstrate critical technologies, functions, and operations
  - Verify critical engineering design factors & environmental impacts
  - Address unknowns or Earth based testing limitations (simulants, micro/low-g, contaminants, etc.)

- **Purpose**
  - Enhance or extend capabilities/reduce mission risk
  - Verify production rate, reliability, and long-term operations
  - Verify integration with other surface assets
  - Verify use of ISRU products

**ExoMars**
- Resource Prospector
- Mars 2020
- Lunar Cubesats

**Mars Surface Pathfinder**
- Lunar short stay

**Utilize/Full Implementation Human**
- Enhance or enable new mission capabilities
- Reduce mission risk
- Increase payload & science capabilities

- **Resource Prospecting/Proof-of-Concept Demos**

- **Engineering Validation & Pilot Operations**

- **Mission Criticality**

- **Earth Supplied**
Leverage (Gear) Ratios using ISRU

Every 1 kg of propellant made on the Moon or Mars saves 7.4 to 11.3 kg in LEO

Potential 334.5 mT launch mass saved in LEO = 3 to 5 SLS launches avoided per Mars Ascent

- **Mars mission**
  - Oxygen (O\(_2\)) only 75% of ascent propellant mass: 20 to 23 mT
  - O\(_2\)/Methane (CH\(_4\)) 100% of ascent propellant mass: 25.7 to 29.6 mT
  - Regeneration of rover fuel cell reactant mass

- **Phobos mission**
  - Trash to O\(_2\)/CH\(_4\) 1000+ kg of propellant

\[
\text{Estimates based on Aerocapture at Mars}
\]

\[
\begin{array}{ccc|cc|cc}
\text{Ground to LEO} & \text{…Adds This Much Initial Architecture Mass in LEO} & \text{…Adds This Much To the Launch Pad Mass} \\
\text{LEO to Lunar Orbit} & 4.3 kg & 87.7 kg \\
\text{(#1→#2)} & \text{LEO to Lunar Surface} & 7.5 kg & 153 kg \\
\text{(#1→#3; e.g., Descent Stage)} & \text{LEO to Lunar Orbit to Earth Surface} & 9.0 kg & 183.6 kg \\
\text{(#1→#4→#5; e.g., Orion Crew Module)} & \text{Lunar Surface to Earth Surface} & 12.0 kg & 244.8 kg \\
\text{(#3→#5; e.g., Lunar Sample)} & \text{LEO to Lunar Surface to Lunar Orbit} & 14.7 kg & 300 kg \\
\text{(#1→#3→#4; e.g., Ascent Stage)} & \text{LEO to Lunar Surface to Earth Surface} & 19.4 kg & 395.8 kg \\
\text{(#1→#3→#5; e.g., Crew)}
\end{array}
\]
ISRU Influence on Mission Architectures

ISRU has greatest influence at the site of the resource/production

- **Transportation** *(propellant is the largest ‘payload’ mass from Earth)*
  - Crew ascent from Moon/Mars surface
    - \( \text{O}_2 \) only provides up to 80% of propellant mass
    - \( \text{O}_2 / \text{fuel} \) – full asset reuse and surface hopping
  - Crew/Cargo ascent and descent from Moon/Mars surface – reusable
  - Supply orbital depots for in-space transportation
    - Cis-lunar (L1 to GEO or LEO)
    - Trans-Mars

- **Power** *(mission capabilities are defined by available power)*
  - Nighttime power storage/generation
    - Fuel cell reactants – increase amount and regeneration
    - Thermal storage
  - Mobile power – fuel cell reactants
  - Power generation: in situ solar arrays, ‘geo’thermal energy

- **Infrastructure and Growth**
  - Landing pads and roads to minimize wear and damage
  - Structures and habitats

- **Crew Safety**
  - Radiation protection
  - Logistics shortfalls (life support consumables, spare parts)
Benefit of ISRU Derived Propellants is a Function of Lander Design, Use, & Rendezvous/Depot Orbit

**ISRU for Lunar Ascent/Descent & Other Destination Use**
- Deliver O₂/Fuel or Water to Depots for usage elsewhere
  - Return to Earth (cis-lunar)
  - Delivery to LEO
  - NEO’s and Mars

**ISRU for Lunar Ascent/Descent & Global Surface Exploration**
- Produce O₂ & Fuel

**ISRU For Lunar Ascent Only**
- Propellant for Ascent Only; Descent Propellant from Earth or Orbital Depot

Requires reusable single stage lunar lander w/ substantial payload capability
- Cryos vs Water

- Requires reusable single stage lunar lander
- Does not require orbital depot for ascent/descent if both O₂ & fuel can be produced on the surface

Approach considered for Constellation & most Lunar architecture studies since it supports two stage non-reusable lander concepts from start

The greater the Delta-V of maneuvers performed by ISRU-derived propellants, the greater the benefit

ISRU Integrated with Exploration Elements
(Mission Consumables)

ISRU Functions & Elements
- Resource Prospecting/Mapping
- Excavation
- Regolith Transport
- Regolith Processing for:
  - Water/Volatiles
  - Oxygen
  - Metals
- Atmosphere Collection
- Carbon Dioxide/Water Processing
- Manufacturing
- Civil Engineering & Construction

Support Functions & Elements
- Power Generation & Storage
- O₂, H₂, and CH₄ Storage and Transfer
- Civil Engineering, Shielding, & Construction

In-Space Construction
In-Space Manufacturing

Life Support & EVA
Pressurized Rover

Modular Power Systems
Solar & Nuclear
Regenerative Fuel Cell
Surface Hopper
Lander/Ascent
Storage

Civil Engineering, Shielding, & Construction
Parts, Repair, & Assembly

Regolith, Metals, & Plastics

H₂O, CO₂ from Soil/Regolith

CO₂ from Mars Atmosphere

Regolith, Metals, & Plastics
ISRU Capability-Function Flow Chart

Survey/Prospect
- Global Resource Assessment
- Site Imaging/Characterization
- Locate Sample/Minining Locations
- Select Mining Site/Anchor to Surface
- Physical/Mineral/Volatile Assessment
- Resource Analysis & Mapping

In-Situ Construction
- Produce Feedstock for Construction
- Gas Resource Preparation
- Resource Acquisition/Transfer

In-Situ Energy
- Solid Resource Preparation
- Consumeable Production
- Extract Oxygen and/or Metals
- Extract Water/Volatiles

In-Situ Manufacturing
- Collect & Separate Oxygen/Metals
- Collect & Separate Water/Volatiles
- Collect & Separate Products

Primary Process
- Concrete 3-D Construction Material Shielding Material
- Metals Plastic Ceramics

Secondary Process
- Oxygen
- Water
- Oxygen Water Fuels Life Support Gases
- Plastic precursors
Mission Consumables: Regolith vs Polar Water/Volatiles

- **Oxygen from Regolith**
  - Can be incorporated into the architecture from the start with low-moderate risk
    - Resource characteristics and parameters are reasonably well known
    - Multiple approaches for extraction possible; 2 demonstrated to TRL 4-5 for short periods of time
  - Provides 75 to 80% of chemical propulsion propellant mass (fuel from Earth)
  - Experience from regolith excavation, beneficiation, and transfer applicable to In Situ Manufacturing and Construction and Mars hydrated soil extraction

- **Water and Volatiles from Polar Regolith**
  - Cannot be incorporated into the architecture from the start with low-moderate risk
    - Resource characteristics and parameters are not well known
  - Polar Water/Volatiles is “Game Changing” and Enables Long-term sustainability
    - Availability of water for propellants can strongly influence propulsion system design (propellant selection and reusability) and transportation architecture (depots, hoppers, lander reuse, etc.)
    - Provides 100% of chemical propulsion propellant mass
    - Reuse of cargo and human landers and transportation elements can reduce long-term mission costs and enable new mission concepts
    - Provides significantly more options for radiation protection, food production, etc. over what is available from lunar regolith

NASA should pursue both Development and Insertion of Oxygen from Regolith with Prospecting and Evaluation of Polar Ice/Volatiles for Long Term Sustainability
Why Perform Analog Field Testing for Science, Exploration & ISRU?

Key Programmatic Analogue Field Test Purpose
- Expand NASA and CSA partnership; Include other International Partners in analogues
- Expand integration of Science & Engineering for exploration, particularly with ISRU
- Link separate technology and system development activities
- Develop and enhance remote operations and mission concepts; introduce new technologies
- Evaluate parallel paths and competing concepts
- Be synergistic with other analogue test activities (past and future)
- Public Outreach, Education, and “Participatory Exploration”

Key Technical Analogue Field Test Purpose
- Stress hardware under realistic environmental and mission operation conditions to improve path to flight
- Improve remote operations & control of hardware for surface exploration and science
- Promote the testing of multiple surface and transportation systems to better understand integration and operation benefits and issues
- Promote use of common software, interfaces, & standards for control and operation (ISECG)
- Focus on interfaces, standards, and requirements (ISECG)
- Focus on modularity and ‘plug n play’ integration (ISECG)

Intrinsic Benefits of Field/Analog Testing
- Develop Scientists, Engineers, and Project Managers for future flight activities
- Develop International Partnerships
- Develop Teams and Trust Early
- Develop Data Exchange & Interactions with International Partners (ITAR)
Lunar Prospecting
- Scarab Rover
- RESOLVE
- TriDAR Vision System
- Tweels

Outpost-Scale O₂ from Regolith
- ROxygen H₂ Reduction
- Water Electrolysis
- Cratos Excavator

Process Control & Science
- PILOT H₂ Reduction
- Water Electrolysis
- Bucketdrum Excavator
- Moessbauer
- Mini Chemin XRD/XRF

- **Canadian Space Agency**
  - TriDAR imager, Satellite communications, remote operation of Drill and TriDAR navigation, and on-site personnel and payload mobility
  - NORCAT, Xiphos, Argo, Virgin Technologies, EVC, Ontario Drive Gear, University of Toronto

- **German Space Agency (DLR)**
  - Instrumented “Mole” & Sample Capture Mole

- **Carnegie Mellon University**
  - SCARAB Rover

- **JPL Partnership with Michelin on ‘Tweels’ testing**
2nd ISRU Analog Field Test: 2010 (1 of 3)

NASA Hardware List & Team Members

Site & Resource Exploration

- RESOLVE Drill
- Combined Moessbauer/XRF
- MMAMA/FSAT Instruments
  - Cone Penetrometers (Dynamic, Percussive, & Manual)
  - Heat Flow Probe
  - Multispectral Microscopic Imager (MMI)
  - X-Ray Diffraction
  - Borehole XRF
  - VAPoR Mass Spectrometer
  - RESOLVE Chemical Plant – Gas Chromatograph
  - Data Integration

Participant/Hardware Supplier
NASA/NORCAT
JSC KA/University of Mainz (Germany) & DLR
Honeybee Robotics
Arizona State Univ.
LaRC, APL/Univ of Wash.
GSFC
KSC, JSC, GRC, ASRC
ARC, UC Davis, & McMaster Univ

Site Preparation & Excavation

- Solar Concentrator & fiber optics with sun tracking system
- Resistive heater surface sintering

Participant/Hardware Supplier
PSI (SBIR Phase III)
KSC
Orbitec
JSC
KSC/ASRC & Honeybee

Oxygen Extraction from Regolith

- Carbothermal reduction module with regolith feed system
- ROxygen Gen 1 water electrolysis module
- Pneumatic regolith lift device

Participant/Hardware Supplier
Orbitec
KSC
KSC/ASRC & Honeybee

Energy

- Solar Concentrator & fiber optics with sun tracking system
- Sunlight flux/intensity measurement instrument
- Power conditioning for fuel cell power system

Participant/Hardware Supplier
PSI (SBIR Phase III)
PSI
NORCAT & JSC

Product Storage and Utilization

- Liquid oxygen/methane tank and cryocooler cart
- Hydrogen hydride tanks
- O₂/CH₄ thruster hot-fire into tephra

Participant/Hardware Supplier
JSC
JSC and CSA
JSC and WASK

8 System Modules – 7 Instruments
6 NASA Centers, 6 Small Businesses, 5 Universities
(42 people plus visitors)
2nd ISRU Analog Field Test: 2010 (2 of 3)

CSA Hardware/Software List

Site & Resource Exploration
- TriDAR vision system (Triangulating LIDAR)
- ERT (Extended Range TriDAR, also called DTO)
- HPC (data compression software) (Hybrid Processing Card)
- Ground Penetrating Radar (3)
- 3D Data Fusion (3D subsurface visualization software)
- EXPLORE (ISRU site selection filter and algorithm software)
- Geotechnical Measurement Equipment (Cone Penetrometer/Shear Vane)

Participant/Hardware Supplier
- Neptec
- Neptec
- Xiphos
- Noggin
- Xiphos
- NORCAT
- NORCAT

Site Preparation & Excavation
- ISRU MAT/ANT Rovers (6) (Multi Agent Teaming/Artificial Neural Tissue)
- Articulated joint (coupling of 2 rovers to accommodate heavy payloads)
- Plow Attachments (3)
- Excavation Attachments: Long (1) & Short (1)
- Autonomous Regolith Delivery system (1)
- Solar Sintering XYZ Table Rastering Device (1)

Participant/Hardware Supplier
- NORCAT/ODG/Univ of Toronto
- NORCAT/ODG
- NORCAT/EVC
- NORCAT/EVC
- NORCAT/Neptec
- NORCAT

Product and Utilization
- Mining vehicle Fuel Cell/H\textsubscript{2} Hydride Tank (1 at 10 KW)

Participant/Hardware Supplier
- NRCan (Natural Resources Canada)

Infrastructure
- Satellite Communications to CSA HQ (Mainland) VoIP service
- Secure telemetry links to other agencies from CSA
- On-Site Wireless Communications
- Multi media studio
- ExDOC Control Center at CSA HQ ( Exploration Development Ops Centre)
- Large Rover (Argo Avenger)
- Lunar Link Emulator (LLE)
- Base Camp (mining camp structures), personnel tracking system
- Food Preparation

Participant/Hardware Supplier
- CSA/CRC (Communications Research Center)
- CSA/CRC
- Virgin Tech
- CSA/CRC
- CSA
- CSA/Ontario Drive (ODG)
- Xiphos
- CSA/NRCan
- YUM Culinary/Cambrian College

12 System Modules & Attachments; Infrastructure
3 Government Agencies, 8 Small Businesses, 2 Universities
(46 people plus visitors)
3rd ISRU Analog Field Test: Lunar Polar Prospecting Mission Simulation

- Rover Communications (CSA)
- Total Station-Relative Navigation (CSA)
- Situational Awareness Camera & Lights (CSA)
- DESTIN Drill System (CSA)
- Avionics & Software (CSA & NASA)
- Solar Array (NASA)
- Artemis Jr. Rover (CSA)
- LAVA Gas Chromatograph/Mass Spectrometer (NASA)
- OVEN Sample (Heating Unit) (NASA)
- Neutron Spectrometer (NASDA)
- Near Infrared Spectrometer (NASA)
- Mission Control, Timeline, Traverse & Data Display Software (NASA)
3rd ISRU Analog Field Test: Lunar Polar Prospecting Mission Simulation

- Rover video camera transmitter
- Rover video camera
- Panoramic Video Camera
- Magnetic Susceptibility Sensor on Actuator
- 3-axis accelerometer
- GPR Control Box
- GPS/Mossbauer/X-Ray Spectrometer Avionics Box
- Mössbauer/X-Ray Fluorescence Spectrometer
- Panoramic Video Camera Controller Box
- 400 MHz Ground Penetrating Radar (GPR)
- Juno II Rover with actuators for Mossbauer, GPR, and Magnetic Susceptibility Probe (CSA)

Mechanized Sample Processing and Handling System (MeSH)

Volatile Analysis by Pyrolysis Regolith (VAPoR)
